COLLEGES AND SEMINARIES FOR WOMEN.

ATTENDANCE OF WOMEN IN COLLEGES AND SEMINARIES.

Provision for the higher education of women is made in colleges and seminaries exclusively for women and in co-education colleges. The entire attendance of young women in the several classes of institutions, for the current year, so far as reported to this Office, was as follows:

Colleges and seminaries for women, Table 43	25,518
Colleges of arts and science, Table 47.....	75,333
Colleges of agriculture and the mechanic arts endowed with the national land grant, Table 52	917
Total	42,633

^a Includes 23 students in the course for women, Columbia College, New York.

Of the three hundred and fifty-seven colleges included in Table 49, two hundred and seventeen¹ admit women, and of these two hundred and one specify the sex of students in their reports. Of thirty-two independent colleges endowed with the national land grant twenty report students of both sexes and of these sixteen specify the sex of students in their reports. This gives a total of two hundred and thirty-seven co-education colleges reporting to the Office, and a total of two hundred and seventeen showing the relative proportion of men and women students.

The following shows the number of colleges and seminaries exclusively for women reporting to this Office each year from 1878 to 1888, inclusive (1883 omitted), with the number of instructors and students:

	1878.	1879.	1880.	1881.	1882.	1884.	1885.	1885-86.	1886-87.	1887-88.
Number of institutions	225	227	227	226	227	236	227	204	156	207
Number of instructors	2,478	2,823	2,340	2,211	2,721	2,989	2,892	2,123	1,854	2,531
Number of students.....	23,639	24,605	25,780	26,041	28,726	30,587	28,868	27,143	20,772	25,818

¹ Does not include Columbia College, New York.

SUMMARIZED STATISTICS.

Table 43 presents the summarized statistics of colleges and seminaries offering collegiate courses of instruction for women. One hundred and thirty-nine of the institutions report preparatory departments whose students comprise 24 per cent. of the entire number reported. One hundred and seventeen of the institutions report themselves as authorized by law to confer collegiate degrees. In general the curriculum offered by these does not differ materially from that of the seminaries not so authorized.

As regards financial particulars the information supplied is very incomplete.

The number of institutions represented in the total value of buildings and grounds is one hundred and seventy-two; in the total of productive funds, thirty-one; in the total income from the same, thirty. The receipts from tuition fees, which form the chief source of income, if charges for board and lodging be excluded, are reported from seventy-seven institutions. State appropriations were reported in eight instances and benefactions in thirty-three. The answers to the inquiry respecting total income have not been included in the summary. They were given in forty-three cases, but were sometimes found to be at variance with the itemized particulars.

DETAILED VIEW OF INSTITUTIONS FOR THE SUPERIOR INSTRUCTION OF WOMEN.

The detailed statistics relating to colleges and seminaries for women are presented in Table 44, Divisions A and B.

For the purpose of showing the status of these institutions more clearly than can be done by the tabulated statistics alone, additional information drawn from reports and other official statements, precedes each division of the table.

REMARKS ON TABLE 44, DIVISION A.

Table 44, Division A, includes a group of institutions whose admission requirements, standards of instruction, and general organization accord with those that have long been characteristic of colleges of liberal arts. Their work is essentially collegiate, in which respect they differ from the older seminaries for women, which, while making more or less provision for the distinctive studies of the college curriculum, are schools for general instruction.

The advantages of endowments, equipments, and teaching force concentrated upon the work of superior instruction, and of the associated efforts of a company of students thoroughly prepared for the pursuit of advanced studies, can not be questioned. The want of these conditions gave rise to the movement for the higher education of women that has swept through the leading nations of the world in the last twenty years, with results that have been productive of the highest good to individual students, and of deep and permanent advantage to society. The United States has been foremost in this movement; its example has been stimulating to other nations, and the history of what has here been accomplished, of the methods and the outcome of the various institutions which have arisen in response to the demand, is the constant subject of inquiry and study on the part of those who are interested in similar efforts in foreign countries.

The movement in the United States has resulted in opening to women the doors of many colleges which were originally limited to men, and in several special endowments for colleges for women.

The latter, which is in general the more costly experiment, has been confined so far to a few States. Between 1855 and 1868 five colleges for women were chartered in New York, two of these, viz, Rutgers College and Ingham University, having been incorporated originally as seminaries; the latter received a college charter in 1852 and the former in 1867. Massachusetts followed with Wellesley in 1870 and Smith College in 1871. The two latest additions to the group of institutions here considered bring into the movement new elements of power. Harvard Annex has solved a problem which has long engaged the attention of those seeking to secure for women the highest intellectual advantages. It brings within their reach all the rich provision accumulated in the oldest centre of intellectual life in our country, and furnishes a precedent soon undoubtedly to be followed by other universities.

Bryn Mawr, on the contrary, affords convincing evidence that the cause of woman's higher education will not be allowed to hang upon the chance of a liberal spirit in existing institutions, or to languish for lack of funds and plans and foundations.

In giving separate tabulation to the colleges in Division A of the table, the purpose has not been to indicate that their work differs essentially from that which is carried on elsewhere; the difference is in the conditions under which the work is maintained. One feature distinguishing these institutions from other seminaries for women is the definite classification of their students. This makes it easy to ascertain the extent of the demand made upon them for collegiate training.

The bearing of the statistics upon this point, it should be observed, can not be well understood without reference to the location of the colleges. They are grouped together in the North Atlantic Division of the United States, from whence the larger proportion of their students are drawn. With this consideration in mind it is interesting to note the statistics of instructors and students as reported for the successive years from 1877 to 1887, inclusive, in the college departments only:

Name of College.	Instructors.		Students.		Instructors.		Students.		Instructors.		Students.		Instructors.		Students.		Instructors.		Students.

b Includes 55 special students in music and painting.

THE HARVARD ANNEX, CAMBRIDGE, MASS.

The Society for the Collegiate Instruction of Women, popularly called "The Harvard Annex," has for its object to repeat for women the instruction given in Harvard College to men. The course leading to the Society's A. B. certificate is the same as that leading in the college to the A. B. degree,—the requirements for admission are the same, the identical papers (printed by the college) being used, and the papers used at semi-annual and final examinations in the college courses are used in the "Annex" for its corresponding courses. Instruction is given by the college teachers (and by no others) and the result of the work of the women is passed upon by the same persons. The college allows the women the free use of its extension library, and the "Annex" is called upon to provide but a few books of reference. The "Annex" has its own laboratories of zoölogy, botany, chemistry, and physics.

Students may enter for a four years' course or for partial or special courses. To meet the variety in the amount and kind of work, three different forms of certificate, to be signed by the instructors, are awarded. The highest, for the full college course, corresponds, as credentials for work done, to the A. B. degree; the second certifies to a liberal course of study during four years, in which other branches are accepted as equivalent for Latin or Greek, while a third is an annual certificate adapted to shorter terms of study.

The attendance for each year from 1879 to 1887-88, inclusive, with the distribution of the students, so far as reported, is as follows:

	1879-80.	1880-81.	1881-82.	1882-83.	1883-84.	1884-85.	1885-86.	1886-87.	1887-88.

Twenty-four States have been represented in the attendance upon the Annex during successive years. Massachusetts, as would naturally be expected, has furnished the majority of the students, the highest number coming from this State in any one year being sixty-seven. The State having the next highest representation in any one year was New York, which sent seven students in 1887. Minnesota and Maine have been represented in a single year by three students each, Connecticut, Michigan, and Ohio by two each. No other State has had at one time more than one representative. All the New England States, two Middle Atlantic, two South Atlantic, two South Central, ten North Central States, and California appear in the geographical list. The steady increase in the annual attendance and the ever extending area from which the patronage comes, show that the provision here made answers to a demand that is neither transitory nor local. The question very naturally arises why this demand should exist, and what is more should make itself urgently felt in view of the provision made for the higher education of women in colleges endowed exclusively for them. The answer is given so clearly in the reports of the Annex that we can not do better than quote from that source.

In his report for 1883 the secretary says: "Women seeking opportunities for the higher education naturally prefer to find them at an institution which is allied, at least, to one established and carried on for men, because they think that there they will be in the line of progress. They feel that on the perfecting of methods and the best application of educational forces the entire body of instructors in such an institution, as well as in all others like it, is united. Present them a course of instruction different from that offered to men, and they do not eye it askance because they think it not so good, but because it is probably just out of the line upon which progress and improvement are to be expected. This is one of the reasons why thoughtful women have less confidence in courses of instruction especially prepared for them than they have in that one upon which the wisdom of men has for generations been working and is still working.

"The society is encouraged by the experience of the past year, because (among other reasons) it has shown more clearly than ever before that there is not only a paramount educational usefulness in the instruction it has afforded, but also a money value in the different forms of certificates that it offers."

As to the classes of women with whom these considerations have weight, the reports are equally explicit.

The ladies of the executive committee, in their report for 1883, make the following statement: "Were every facility offered them, however, we hardly suppose that women would ever look upon a college course of study subsequent to their school life as an inevitable or even necessary part of their education; nor do I think it would seem to any of us desirable that they should do so. But this being granted, there still remain quite enough for whom such a completion of their earlier training is important in view of their occupation as teachers, and if there are others who ask it purely for its own sake, we surely should not deny them.

"With reference to the former class, we must remember that our interests are at one with theirs. The standard of our public and private schools can never be a matter of

indifference to parents, and that standard can hardly fail to be raised by the closer relation of the schools to the universities. Thus far our Annex students have belonged to the classes of women named above. They have been young women fitting as teachers, or older women who are already teachers, but who allow themselves, out of their small earnings, the rare luxury of a little change from teaching to learning, that they may go back to their work refreshed and better prepared; or women of scholarly tastes, with means to gratify them, who come, as I have said, to study under higher auspices simply because they enjoy it. We have had as yet no flighty students, brought by the novelty of the thing, and very little fragmentary, half-digested work."

The proportion of students attracted to the Annex from the simple desire of a high order of instruction increases somewhat, apparently, although the statistics upon this point are meagre, but the larger proportion of each year's attendance has been of students preparing for the teaching profession. The evidences are abundant that their opportunities for remunerative employment and their actual power as teachers and consequent satisfaction in the work are greatly increased by the training.

It was not until the sixth year of its operations, viz, 1885, that the Annex came into possession of a building. This greatly increased its advantages and its influence. The report for 1887 states: "In view of the increasing numbers, the society has secured additional lots adjoining its estate which nearly double its extent, and will allow for future additions, for gymnasium, laboratories, etc. In fact, one building on the newly acquired estate has already, by the liberality of friends, been transformed into a laboratory of chemistry, a convenience much-needed, and classes are actually at work in its cheerful apartments.

"The physical laboratory, situated in our main building, proved inadequate for the use of our classes last year, as was stated in the last Annual Report, and the executive committee determined to enlarge it. This has been inexpensively accomplished, and there is now twice as much available room as there was before. There is still great need of apparatus both for physics and chemistry, and the funds at the society's command are not sufficient to supply it."

Efforts to secure a permanent endowment fund were begun by the ladies of the executive committee in 1883. They have succeeded in raising a fund of \$70,000, and their efforts in this direction continue with unabated energy.

BRYN MAWR COLLEGE, BRYN MAWR, PA.

The tabulated statistics of Bryn Mawr College show a steady increase in attendance during the three years of its history, and the president reports that the entrance examinations for 1887-88 give evidence of a better preparation on the part of candidates than formerly. During the year the trustees have added three members to the faculty, as associates in English, mathematics, and history. A physical laboratory has also been erected and a department of physics added.

The curriculum is arranged on the group system, which is described as follows in the programme for 1887-88: "In all departments as yet organized there is a course of five hours a week for two years, called a major course. Whenever one year of this course is of such a nature that it can be taken separately it is marked as a minor course. It is required of every candidate for a degree to take two such major courses as shall be homogeneous, or shall complete each other, and major courses which fulfil this condition are designated as groups. It is meant that the student, under this system, should lay the foundations of a specialist's knowledge, and the required studies, namely, English, philosophy, and science, or history and science, are intended in part to supplement the group, and in part to insure a more liberal training than could be achieved did every student combine elective studies at pleasure.

"The two years' required course in English includes a general introduction into the study of language. English literature will be treated with steady reference to the comparative history of literature; and the entire course will be so planned as to give unity and domestic application to the pursuits of students of philology, and to acquaint students of science or of history, in so far as this is possible in a special course, with the results, scope, and methods of the study of language and literature. The required two years in science or in science and history permit the student of chemistry and biology to pursue both branches of the biological course, or to take a major course in physics; and they insure to the student of history and of language for one year at least the same kind of instruction and discipline as is received by the scientific student. The one year's course in philosophy is a general introduction into the study of the laws, conditions, and history of thought."

A tabular statement of the courses leading to a degree is here presented:

*Minor courses (one year each).**

1 and 2	3	4	5	[6]	[7]
English (two courses).	Philosophy.	Science, Physics, or Chemistry or Biology.	Science or History.	French, or German, or Greek.	Solid Geometry and Trigonometry.

* Except 7. (One-half year.)

Two major courses (two years each).

Constituting any one of the following groups:

1	2	3 *	4	5
Any Language with any Language.	Any Science* with any Science.	Mathematics with Greek or Latin.	Mathematics with Physics.	History with Political Science.

Free electives.

Five hours weekly for a year and a half.

The "minor courses" in the above table are known as the required studies; the "two major courses" as the group. All studies whatsoever fall under one of these heads: "required studies, group, or free electives."

The following statement from the president's report for 1886-87 shows the subjects chosen by the students for their major courses during 1885 and 1886:

"By forty-six students that entered in the years 1885 and 1886, the following major courses have been selected: Greek and Latin, 15; Greek and English, 1; Greek and mathematics, 4; Latin and English, 1; Latin and German, 1; English and French, 1; English and German, 3; German and French, 4; mathematics and physics, 1; history and political science, 5; chemistry and animal biology, 9; chemistry and vegetal biology, 1. Thus it appears that of twenty-six who chose two languages in combination, fifteen took the two ancient ones, eight took modern ones, and three combined an ancient and a modern language. The proportion selecting physics would doubtless have been larger had there been a department of physics during the first two years of the college."

Bryn Mawr College awards five fellowships annually, "one in Greek, one in English, one in mathematics, one in history, and one in biology. They are intended to be an indorsement of previous attainments and entitle the holder to free tuition, a furnished room in the college buildings, and the sum of \$350 yearly. They are open to graduates of Bryn Mawr College, or of any other college of good standing. No one may compete that has not a college degree or a certificate of prolonged study under well-known instructors; and, generally speaking, the fellowship will be given to the candidate that has studied longest or whose work affords the best promise of future success."

The Bryn Mawr European Fellowship is also awarded "annually to a graduate of Bryn Mawr College on the ground of excellence in scholarship. The holder receives the sum of \$500, applicable to the expenses of one year's study and residence at some foreign university, English or continental. The choice of a university may be determined by the holder's own preference, subject to the approval of the college."

ART SCHOOLS IN COLLEGES FOR WOMEN.

In both colleges and seminaries for women great attention is given to music and to the plastic arts. In general the provision for instruction in these branches is good, and in many cases it is of a very high order.

The universal recognition of these branches in a scheme of instruction for women is

not sufficiently explained by their mere value as social accomplishments, but is undoubtedly due in some measure to their essential value as instruments of culture. Moreover, it is evident that women are likely to have much more opportunity than is offered by the average lives of men for continued development in these directions. Hence, in giving prominence to art studies in the curriculum for women, the best provision is made for the maintenance of the artistic element as a part of human development.

The colleges which have arisen in response to the demand for higher scholastic privileges for women have not laid less stress than the older seminaries upon the department of æsthetics. Vassar, Smith, and Wellesley present a very full equipment in this respect.

SMITH COLLEGE, NORTHAMPTON, MASS.

SCHOOL OF MUSIC.

The aim of this school is to provide the best facilities for students who desire to pursue any branch of music, practical or theoretical. The school is located in Music Hall, which furnishes ample accommodations for practice, lectures, and public performances.

Candidates for admission to this school must be at least sixteen years of age, and furnish satisfactory evidence of having completed a course of study equivalent to that of a standard high school; and also Nos. 4 and 5 and either No. 1, No. 2, or No. 3 of the following courses of musical study:

(1) *Piano*: *a* Études for Technique; Czerny, Op. 740, first three books; Clementi's Gradus ad Parnassum, first book (or Cramer's Exercises, first two books). *b* Compositions; Mendelssohn's Songs without Words; Beethoven's Sonatas, Op. 2, No. 1; Op. 7; Op. 10, No. 1; Op. 14, No. 2.

(2) *Voice*: Concone's or Bordogni's Vocalises; Songs by Franz or Schubert.

(3) *Organ*: Stainer's Organ Method (or Buck's Exercises in Pedal Phrasing).

(4) *Notation*: The Theory of Rhythm and Tonality, Scales and Keys, Transposition and Modulation.

(5) *Harmony*: Principles of Four-part Composition, as far as the "Suspension," as given in Richter's Manual. Equivalents for these works will be accepted.

Students of music who desire to pursue studies in connection with the college classes will be allowed to do so on fulfilling the requirements for the admission of special students. Proficiency in music will, however, receive due consideration in the estimate of preparatory work, but will not be accepted as an equivalent for more than one of the courses required.

Students connected with the academic department or with the school of art are allowed to choose music as an elective study under the conditions which regulate the choice of other electives, provided that they devote to it not less than six hours a week of practice besides the work in harmony. In the arrangement of the studies, however, three hours of practice in music are considered the equivalent of one hour of regular recitation.

The regular course of study covers three years, and the degree of Bachelor of Music will be awarded to students who complete the course. To students who are not candidates for this degree, certificates specifying the amount and quality of the work done are given when they leave the school.

SCHOOL OF ART.

The aim of this school is to furnish practical and theoretical instruction in the principles of the arts of design,—drawing, painting, and sculpture, including the elements of architectural styles and decoration. The Hillyer Art Gallery offers rare advantages for the study of art. An endowment of fifty thousand dollars has been provided by bequest of Winthrop Hillyer for the perpetual increase of the art collection.

Requisites for Admission.—Students who desire to devote their time exclusively to the study of art will be admitted upon satisfying the president and the teachers of the school of their ability to do the work required. But candidates for admission who wish, in addition to their work in art, to take studies with the college classes, must be at least sixteen years of age, and furnish evidence that they have completed the courses of study required for the admission of special students.

Proficiency in art will, however, receive due consideration in the estimate of preparatory work, but will not be accepted as an equivalent for more than one of the courses required.

All members of the college are allowed to choose art as an elective study, under the conditions which regulate the choice of other electives, provided that they devote to it not less than six hours a week. In the arrangement of studies, three hours a week of practical work in art are considered the equivalent of one hour of regular recitation.

The regular course of study extends through four years, and diplomas will be awarded to students who complete it.

Instruction is first given in free-hand drawing from casts and artistic objects; afterward in drawing with crayon or charcoal from living models; students are then taught to draw from nature, with out-door practice.

Painting in oil or water-color, sculpture, and etching are begun as soon as the rudiments of art are sufficiently comprehended.

The principles of composition in painting, sculpture, and decoration are taught by lectures, and enforced by regular practice upon subjects assigned by the teacher.

Courses of lectures supplementary to the practical study of art are also given upon perspective, anatomy, artistic expression, and the history of painting and sculpture.

Students are not allowed to take advanced work until they satisfy the teachers of their ability to do so.

WELLESLEY COLLEGE, WELLESLEY, MASS.

Wellesley has received by bequest of the late *Isaac D. Farnsworth* funds for the erection of an art building, which will be ready for occupancy in September, 1889. Beside lecture-rooms, galleries for collections, and studios for those engaged in drawing and painting, a special feature in the plan of the building is the arrangement of small reading-rooms and libraries, so that the books and art material relating to particular subjects and periods can be made immediately available to general students.

The *School of Art* is already furnished with a collection of over three thousand photographs, engravings, etchings, and drawings; a series of stereoscopic views illustrating the history and art of different nations and periods; a collection of paintings in oil and water colors; copies of ancient armor; a ceramic collection; coins and pieces in bronze and iron; one hundred statues and busts, and a large collection of casts from the antique.

The following statements from the current catalogue show the general conditions under which art instruction is carried on in the colleges specified:

SCHOOL OF MUSIC.

The School of Music, is located in Music Hall, which contains thirty-eight music-rooms and a hall for lectures and choral singing. Forty-three pianos and two large organs are furnished for the use of students. The organ presented by Mr. W. O. Grover has three manuals, each of sixty-one notes, a pedal of thirty notes, and twenty-six speaking registers. It contains 1,584 pipes.

Requirements for Admission.—Candidates must meet the general requirements for admission, and, unless accepted on certificate covering the following requirements, must pass satisfactory examinations in—

Mathematics, as required for the Freshman class.

Latin, as required for the Freshman class.

French and German may be substituted for Latin history, Greek and Roman (Smith and Merivale's).

Outline of English and United States history.

English literature. (Shaw's Manual, or an equivalent.)

English composition, as for the Freshman class.

Geography, as for the Freshman class.

Special students for any musical study will be received; but in all cases the above requirements must be met unless exceptional advancement in music can be urged as an equivalent for one required subject.

Courses of Study.—Three full courses are offered, each extending through five years; students at all times taking three studies, two lessons per week in each.

(1) Piano: Harmony and composition, and German or French.

(2) Organ: Harmony and composition, and German or French.

(3) Voice: Harmony and composition; two years Italian; three years German or French. Violin, viola, violoncello, harp, or any orchestral instrument may be made a specialty instead of the above-mentioned principal studies. Theory and *Æsthetics* and lectures on history of music, last year of each course weekly.

Students who complete either of these courses will receive the diploma of the School of Music, and if specially talented and deserving the degree of Mus. B.

The five years' classical or scientific and musical course.—Students entering the classical or scientific course may combine the regular study of music with the work required for a degree, the collegiate studies extending through five years instead of four.

Harmony and musical theory.—A thorough knowledge of the principles and practice of this branch of musical science is a prime necessity to every musical student. Without it no one can obtain clear and comprehensive views of the formation and character of musical composition. While it is not as yet a requisite for entrance to the School of Music the director urgently recommends that every member will at some period in her

course include harmony with her musical work. It is better that this should be continued for two years. All graduates must be able to pass a satisfactory examination in harmony and in the outlines of musical history.

Emery's Elements of Harmony. Richter's Manual (translated by J. C. D. Parker). Richter's Counterpoint (translated by Franklin Taylor). Richter's Fugue (translated by Arthur Foote). Wohlfahrt's Guide to Musical Composition.

Ensemble playing.—Facilities are offered for the study and practice of chamber music, the fantasies, romances, sonatas, and trios of the great masters for the piano and violin, with addition of violoncello and occasionally other instruments.

Analysis and interpretation.—Classes in analysis and interpretation of classical works will be formed by the director, in case it is desired by at least six students.

Concerts and lectures.—At frequent intervals recitals and concerts will be given by the advanced students in the several departments by members of the faculty of the School of Music and by distinguished musicians from Boston and elsewhere.

Lectures on theory and æsthetics and on the history of music and musicians are given throughout all the courses by the director and non-resident lecturers.

SCHOOL OF ART.

The purpose of the School of Art is twofold; while providing technical instruction in drawing and painting, it aims to supply such acquaintance with the arts in their history, philosophy, and criticism as may profitably supplement the work in other departments of study.

The course in technical training covers five years. The requirements for admission to it are the same as those for the School of Music. Students may enter an advanced class at any time by presenting satisfactory specimens of the work required in the previous years of the course.

The studies in the history and theory of art are counted among the regular college electives. Lectures upon these subjects are open without fee to all members of the college.

VASSAR COLLEGE, POUGHKEEPSIE, N. Y.

SCHOOLS OF PAINTING AND MUSIC.

The departments of painting and music, beside providing for the instruction of collegiate students, constitute schools for special instruction in these arts. The professors of these departments are the directors of the art schools, to whom, respectively, in connection with the president, the internal management of the schools is committed.

In the Junior and Senior years students who show marked proficiency in either of them, and whose general standing for scholarship is good, may, with the approval of the faculty, take one of these arts as an equivalent to a collegiate study; but in such a case harmony must be included with music. Two lessons a week in these arts are allowed to students in connection with their college studies, with a daily practice period.

Applicants for admission to either of the art schools as resident students must present testimonials of good character, and must be able to pass a satisfactory examination in such studies as may serve to grade them in their collegiate work. They must also give evidence of sufficient natural talent for the art in which instruction is to be given.

A full course of study in either department covers three years, but students who have already attained some degree of proficiency may finish the course in a shorter time.

Special courses adapted to the circumstances of the student may be arranged by the director, with the approval of the president; but no student is allowed to pursue a course of study that has not been sanctioned by the proper authorities.

Diplomas are awarded to those who have completed a full course and passed all its required examinations; to others certificates will be given on their leaving, stating what they have actually accomplished.

Vassar possesses a fine gallery of art, to which additions are constantly made from a special art fund.

REMARKS ON TABLE 44, DIVISION B.

Table 44, Division B, presents the statistics of two hundred seminaries for women. Of these one hundred and thirty-seven report preparatory departments, with 6,202 students. This leaves 19,202 students, of whom 67 per cent. are known to be in collegiate departments; the distribution of the remainder is uncertain.

The majority of these seminaries are in possession of valuable buildings, as will be seen by reference to Column 24.

A few are well equipped with libraries and apparatus, though, as a rule, larger provision in these respects is desirable. Endowment funds are generally wanting, as will be seen by an examination of Column 25.

In their general arrangement the academic or collegiate departments of these seminaries show the influence of the colleges of their respective geographical sections. In the North they are generally divided into four classes, each corresponding to a year; in the South, on the contrary, the division is commonly into schools.

The curriculum is a more or less modified copy of the college curriculum, with large opportunity for electives and for partial or special courses. The adjustment of studies is the evidence of a double purpose in the seminaries. On the one hand they have endeavored to meet the general demand with respect to woman's education. On the other they have sought to maintain that higher ideal which would appropriate for women as well as for men the advantages of the kind of instruction and training approved by wise effort and long experience as the best for mental discipline and culture. When to this double purpose there is the added responsibility of preparatory work it is obvious that some part of the scheme must fail of satisfactory results. Under such circumstances a process of selection goes on quietly, perhaps, but none the less certainly, and in time makes itself felt in entirely new adjustments. Such a process has been going on in the seminaries for women throughout the country. Some have developed into colleges proper; others are gradually assuming the distinctive character of schools preparatory to college; while many, abandoning to the colleges the work which is their particular province, seek to make provision for that very large class of young women to whose wants the customary college training is not adapted. This separation of functions has been fully accomplished in but few localities, but will undoubtedly take place in others as colleges for women and colleges open alike to both sexes multiply.

In the absence of endowment funds the charges for board and tuition become the sources of support. Experience proves that this is not a condition favorable to the highest development of a scholastic work, but, on the other hand, it is conducive to a clear understanding of existing demands. In their recognition of these demands and the measures adopted for meeting the same, these seminaries have escaped the charge frequently made against the superior schools for men of having lost touch with the interests of actual life.

Sixty-four per cent. of the seminaries tabulated belong to some one of the religious denominations. This relation is sometimes merely a nominal one, and sometimes implies oversight and financial aid from the denomination. The relation has fostered a high order of moral training in the seminaries, and has done much to develop that zeal for charitable and missionary labors which characterize a large proportion of the educated women of the country.

Brief notices of a few endowed seminaries or of seminaries that had been the special objects of denominational care are appended to this general view. The selection has necessarily been limited to such as have furnished very full information to this Office. They are fairly illustrative of the entire number.

Judson Institute, at Marion, Ala., is one of the oldest seminaries for women in the country. It is the property of the Alabama State Convention, and its affairs are in the hands of a board of trustees appointed by that body. Its officers and teachers all receive stipulated salaries, so that they are freed from dependence upon the pecuniary profits arising from its management. Its scholastic standards have always been high, the full graduating course corresponding to that of the arts colleges. It has enjoyed a large patronage, and numbers above five hundred alumnae.

The institute is in possession of a fine property. The buildings, which have been recently enlarged and newly furnished, were unfortunately destroyed by fire November 24. The estimated loss is one hundred thousand dollars, one-fourth of which was covered by an insurance. Temporary provision was at once made for continuing the exercises of the school and steps taken for the immediate restoration of the building. It will be constructed on a much larger scale than the old building.

Wesleyan Female College, Macon, Ga., received a charter in 1836, authorizing it to confer degrees upon women. The charter of Oberlin preceded this by a few years, but the Wesleyan Female appears to have graduated women from its college course earlier than Oberlin.

The college has a deservedly high reputation, and numbers one thousand nine hundred and eighteen graduates. Its productive fund amounts to fifty thousand dollars. The grounds are extensive and attractive. The college building contains a gymnasium, a museum of natural history, an art gallery, and a library well supplied with choice literature and books of reference. In addition to the main structure is a building containing a chapel and recitation rooms. Several hundred dollars have been expended in the scientific department for securing the most approved apparatus for the illustration of chemistry, natural philosophy, and astronomy.

Silliman Collegiate Institute, Clinton, La., reports productive funds to the amount of twenty-seven thousand dollars.

The catalogue for 1887-88 furnishes the following particulars: "The school was established in 1852, chiefly through the benevolence of Mr. William Silliman. In 1866 he purchased the property and donated it with an endowment fund of twenty thousand dollars to the Presbytery of Louisiana. The conditions of the donation were that the Presbytery, through its agents and trustees in perpetual succession, should conduct said institution as a college for young ladies, to be kept free from all sectarian tenets and religious dogmas. 'The object of the donor being,' he said, 'to give to the public an institution of learning, where all denominations may send their children without interfering with the religious prejudices of any.'

"To this fund several thousand dollars have since been added, making this the wealthiest female college in the South-West, and thus enabling it to offer superior advantages, both in scope of curriculum and assistance to worthy pupils. The entire management of the institution is in the hands of a board of trustees, created by this Presbytery, irrespective of denominational tenets."

The large brick buildings, which were erected at a cost of thirty thousand dollars, present a handsome appearance; they are surrounded by attractive grounds embracing ten acres.

The laboratory is supplied with costly apparatus for philosophical and chemical experiments and the class-rooms are well furnished with maps, charts, and globes.

The annual interest from the Silliman Fund furnishes tuition to about thirty young ladies selected by the board of trustees from applicants the least able to bear the expense of education.

The *Dickinson Memorial Fund* was donated by the late Mrs. A. R. Dickinson, of Plaquemine, La. The interest of this fund is used for the tuition of the daughters of Presbyterian ministers.

The standards of scholarship have been materially advanced during the past four years.

Frederick Female Seminary, Frederick, Md., is one of the oldest incorporated institutions in the State.

In 1840 the State Legislature granted a full charter and gave authority to raise fifty thousand dollars for the purchase of grounds and the erection of suitable buildings.

The requisite funds having been secured, a building was erected and the seminary organized in 1843.

The original buildings were two in number, each fifty feet wide and ninety feet deep, with high basement and three stories.

During the present year extensive additions have been built and the grounds greatly improved. During the Civil War the work of the seminary was suspended for a time. With the return of peace it was reopened and has since been continued without interruption. The productive funds amount to \$24,000.

The seminary comprises a preparatory and collegiate department, the latter consisting of two courses, English and classical. Latin and Greek are included in the classical course, but for the latter French or German may be substituted. The number of graduates to date is two hundred and eighty-eight.

Of seven institutions for the Superior Education of Women in Massachusetts, tabulated in Division B, Table 44, four report productive funds.

Abbot Female Academy at Andover, chartered January 29, 1829, and opened May 6 of the same year, was the first academy incorporated for girls only in the State. Its records show a long list of benefactors, to whose fostering care the academy is indebted for its ample buildings with their admirable equipments as regards library, cabinets, apparatus, art collections, and gymnasium.

The curriculum is arranged in two courses; the English and Latin course covering four years, and the French and German course three years. Both courses give opportunity for electives. An efficient corps of teachers is always employed and high standards maintained. Ten scholarships have been founded in the academy. The amount of permanent productive funds reported is \$16,084. A building fund has also been accumulated during the last four years, which amounts now to \$36,523, of which \$5,847 were given during the current year.

Bradford Academy, founded in 1803 and chartered in 1804, is the oldest incorporated institution in the country to which women were admitted from the first. It was conducted as a school for both sexes until 1836, when the male department was closed.

It occupies a fine site, commanding views of the beautiful scenery of the Merrimack Valley. The building is spacious and supplied with all the appurtenances of a fine educational work. The grounds comprise above twenty-five acres, twelve of which are covered with a growth of oak and laid out with paths for exercise and recreation.

Great care has always been taken to secure superior teachers, and the records of the academy show the names of many who have achieved wide reputation. The regular academic course includes Latin and Greek, with French or German. The studies are so arranged that three are assigned for each term, the course being completed in four years. Special courses are provided for those who come for a less time.

The permanent productive funds amount to \$33,000.

The *Semi-Centennial of Mt. Holyoke Seminary* was celebrated with great enthusiasm and success June 22 and 23, 1887. The following particulars are derived from the volume containing the account of the proceedings:

Two semi-centennial days had been observed in 1886, viz, the granting of the seminary charter February 10 and the laying of the corner stone, October 3. Prior to 1836 but two schools for girls only had been chartered in the State, viz, *Ipswich Academy* in 1828 and *Abbot Academy* in 1829. The former had no endowment to secure its continued existence, and the latter was not designed exclusively to furnish the higher education, and for nearly forty years required no examinations for admission. The charter of *Mt. Holyoke Seminary* legalized the holding of funds gathered—though with great opposition and ridicule—to found a permanent institution, designed to do for young women what colleges for two hundred years had been doing for young men.

These funds were the voluntary gifts of benevolence and were all spent in building. In the entire lack of endowed departments, running expenses had been met for half a century from board and tuition fees; these were kept at the lowest figure practicable, that the seminary course might be "within reach of the class most likely to be benefited by it and to use it for the good of the world." In view of these facts, when the desire of making a jubilee gift to their *alma mater* was expressed in the annual meeting of the National Association of Holyoke Alumnae, June, 1885, the proposition to secure endowment for the chair of the principal met with a warm response, and it was resolved to raise for this purpose before June, 1887, the sum of twenty thousand dollars, to be called the Mary Lyon Fund. To devise means for the accomplishment of this purpose a committee was appointed of which Mrs. Helen French Gulliver was chairman.

Mrs. Gulliver's report, presented at the anniversary, showed that the fund had reached the sum of \$28,150 and was still increasing.

The work of the committee will be continued with the hope of raising an endowment adequate to the larger demands of the college organization upon which *Mt. Holyoke* has just entered in accordance with the act of the Legislature March 8, 1888. By this act the name is changed to *Mt. Holyoke Seminary and College*, and power is granted to confer "such honors, degrees, and diplomas as are granted or conferred by any university, college, or seminary of learning in the Commonwealth."

By reference to Column 25, Table 44, Division B, it will be seen that the productive fund has reached the sum of \$205,000.

The growth of the seminary is well illustrated by the increase of its teaching force in the fifty years of its history. In 1837 the faculty consisted of one principal, one associate principal, two teachers, and three assistant pupils, and, so far as appears from the catalogue, without any division of labor or distribution of departments. In 1887 there are over thirty teachers, each one of whom has her department of instruction and her especial work.

The roll of graduates numbers two thousand, which, with four thousand non-graduates, makes up a past membership of six thousand. Three-fourths of this number have been teachers; two hundred have been foreign missionaries; the alumnae records show that one thousand seven hundred and eighty-seven of the graduates have married.

In the review of the work of the seminary attention is called to the great number of institutions which have been founded by graduates of *Mt. Holyoke*, or organized upon the same plan.

In this connection the fact was noted that Mr. and Mrs. Durant gave some time to the special study of the workings of *Mt. Holyoke* when they were forming their plans for the foundation of Wellesley College. Sixty-one seminaries, academies, and high schools, all of excellent reputation, are enumerated whose principals or prominent teachers had been students of *Mt. Holyoke*.

The treasurer of the alumnae association submitted the following report for the fifteen years from 1862 to 1887:

"The cash receipts of the treasurer in these fifteen years amount to \$35,096, of which

\$23,350 belong to the Mary Lyon Fund; \$1,869 were given toward building and furnishing Williston Hall; \$1,104 for the mineralogical and geological cabinets; \$1,145 for the educational fund; \$365 from the Boston and Worcester Alumnae Associations for microscopes; \$500 in one donation for the green-house; \$500 in another for improvements in the seminary hall; \$500 were received from a legacy of Edie McKennan.

"Though the Tolman Fund of about four thousand dollars, the income of which is designed for the benefit of weary teachers, did not come into our treasury, it should be mentioned here.

"Besides these gifts of money, there have been numerous and valuable gifts from individuals and classes of which a grateful record is kept with names of donors. These have not only aided in filling the cabinets and art gallery of Williston Hall and furnishing its various departments, but have also contributed in many ways to the comfort and enjoyment of the household. The estimated value of gifts from classes alone is not less than four thousand dollars. Our missionary alumnae have kept us in constant remembrance by their gifts of rare and costly antiquities from various lands. The department of natural science has also been greatly enriched by contributions through the same channel."

The following description of buildings and equipments is from the catalogue of 1887-88:

"The grounds, comprising nearly seventy acres, slope to a stream which broadens into a pond. A driveway leads across this stream and ascends the hill, which bears the name of Goodnow Park, in honor of the donor, Hon. E. A. Goodnow, of Worcester. The pond, furnished with boats and boat-house, affords opportunities for rowing.

"The main edifice, which fronts west, has at each end a wing extending eastward; the extremities of the two wings are connected by the gymnasium, thus enclosing a quadrangle.

"Steam heat is supplied throughout, and an elevator gives easy access to the upper stories. Pure water is furnished in abundance from an artesian well four hundred and fifty feet deep.

"The library, a fire-proof building connected with the main edifice, has recently been enlarged. The new room is filled with cases compactly arranged so that twenty-five thousand volumes can be shelved within easy reach. The library is open fourteen hours a day; at present it contains twelve thousand volumes, selected with careful reference to the courses of study. There is a card catalogue and also a classified index. The reading-room, near by, is well supplied with newspapers and magazines."

The Lyman Williston Hall (finished in 1876) stands north-east of the other buildings, surrounded by a spacious lawn. It contains large and well-appointed rooms for lectures and recitations, extensive cabinets, a chemical laboratory for practical work, and valuable philosophical apparatus.

The art gallery occupies the entire upper floor of this building, including a large central apartment with several adjacent rooms.

An astronomical observatory was completed in June, 1881. It contains a fine telescope with an eight-inch object glass, also a meridian circle, astronomical clock, chronograph, sextant, spectroscope, and other appliances. This building, with its equipments, as well as the lot on which it stands, is the gift of A. L. Williston, Esq., of Northampton, in memory of his son, John Payson Williston.

In assuming the special function of a college it is not proposed to interfere at all with the work of the seminary. The distinction between the two as regards admission requirements and curriculum illustrate very clearly the differences in general between seminaries and colleges for women.

For this reason an outline of both works is here presented.

Admission requirements to Seminary.—*Mathematics.*—Mental and written arithmetic, including the metric system of weights and measures; Olney's Complete School Algebra (an elementary work is not sufficient); plane geometry.

In order that a requisite mathematical discipline may be gained, it is desirable that there be a familiar acquaintance with two or three authors in higher arithmetic. A careful review of mental arithmetic is also important.

Latin.—Latin grammar, Jones's Latin Prose Composition, Caesar's Gallic Wars, four books, or an equivalent amount of Cornelius Nepos, or Sallust; Cicero, seven orations. A thorough acquaintance with the principles of syntax is required. The English system of pronunciation is preferred.

English.—Knowledge of principles as given in *How to Write Clearly*, by E. A. Abbott, or in Welsh's *Essentials of English*; correction of errors in syntax, and an essay on an assigned subject.

Geography; also Guyot's Physical Geography, Parts II and III, or an equivalent. History of the United States.

Although well-qualified candidates may be admitted to the entering class at sixteen years of age, it is better that all should be seventeen or eighteen. None should enter the Senior class under twenty.

The prescribed studies of the seminary course are as follows: Latin; Ancient and Mediæval Literature; French or German¹; English Literature; Rhetoric and Philology; Logic; Mathematics. The required course includes plane, solid, and spherical geometry, algebra, and plane and spherical trigonometry. Physics; Astronomy; Chemistry; Mineralogy, Lithology, and Geology; Physiology and Hygiene; Zoölogy; Biology; Botany; History. Two courses, one in ancient and the other in mediæval and modern history, are required. Civil Government; Mental and Moral Science; Theism and Christian Evidences; History of Art.

Course of Study.—The prescribed curriculum is arranged to occupy four years. It is the aim of the course to give a solid and well-balanced education in those things which are fundamental, at the same time encouraging and providing for further study in whatever department it may be desired. The special courses arranged in French, German, and Greek, as well as in some of the sciences, are additional to the regular curriculum.

The college curriculum is substantially the same as that of other arts colleges. It presents a higher range of the seminary studies. Greek appears among the prescribed subjects, and large provision is made by electives for special courses in the modern languages, Ancient and Modern Literatures, Physical Science, Psychology, Ethics, Philosophy, Æsthetics, Political Economy, and International Law.

In accordance with the time-honored traditions of Mt. Holyoke the new department makes special provision for the study of the Bible and of Theism and Christian Evidences.

Greek is omitted from the scientific course, and Latin is pursued but two years; the first as a prescribed and the second as an elective study.

The college courses, classical or scientific, occupy four years.

The Industrial Institute and College for White Girls, Columbus, Miss., derives its entire income from State appropriations.

In his report to this Office for the current year the president says: "This institution was established by the State of Mississippi by act of Legislature, approved March 12, 1884. First session opened October, 1885. Its design is to afford white girls of Mississippi opportunity for education in the arts and sciences, training in music, fine arts, and industrial arts. Its success, as attested by popular favor and the record of its pupils now engaged in teaching in academic and industrial schools, as well as by the number of pupils earning good salaries in telegraphy, phonography, book-keeping, decorative art, and other lines of profitable employment for which they were prepared here during the first three sessions, is already beyond the hopes of its most earnest advocates and inaugurators."

Lindenwood College, St. Charles, Mo., was opened as a private school in 1830. In 1854 it was chartered as a college in view of liberal gifts for its establishment, made by two citizens, Maj. George C. Sibley and S. S. Watson, Esq. In 1870 it was placed under the control of the Presbyterian Synod of Missouri.

The college buildings were erected expressly for the purposes they serve. They are surrounded by spacious and beautiful grounds which afford fine facility for exercise.

The endeavor was early made to secure an endowment fund for the institution in order that the various departments might be freed from dependence upon tuition fees. The efforts were so far successful that in 1871 upwards of forty thousand dollars had been secured. This, however, appears not to have been invested as a permanent fund, and the catalogue of 1885-86 stated that the college had no endowment. The next year (1887) a fund of twelve thousand dollars was reported, of which ten thousand appeared to be a recent gift. Renewed efforts are being made to raise the endowment to a sum commensurate with the high purposes of the college, and also to increase the provision for laboratory practice. The course of the college department is an extensive one, covering four years. Only those who complete the same receive the college diploma.

The Greensborough Female College, Greensborough, N. C., reports a small productive fund, amounting to three thousand dollars.

The following particulars of its history and equipment are from the catalogues for 1881-82 and 1885-86:

The college was founded by the North Carolina Conference and chartered in 1838, being the first incorporated college for women in the State. It was opened for students in 1846 and continued in successful operation until its destruction by fire in 1863. It was reopened in 1873, and in 1881 was bought by a number of citizens living in different parts of the State.

¹Greek may be substituted.

The college building is located near the western limits of Greensborough, in the centre of a campus embracing forty acres, a large portion of which is finely shaded. It is very large, commodious, and well adapted to school purposes, containing a capacious chapel and dining-room, study hall, lecture, recitation and music rooms, parlors, an art studio, and dormitories sufficient to accommodate two hundred boarders.

The authorities of the college have recently appropriated one thousand dollars for the purpose of purchasing books and adding to the chemical and philosophical apparatus.

The patronage of the college is chiefly Methodist, although other denominations are represented.

Candidates for a full diploma must pass the required examination in the regular English course and in one ancient or modern language. Many of the graduates and former students of the college fill responsible places as teachers. The two past years have been the most prosperous ones in its history.

Four seminaries for women in Ohio report productive funds as follows: *The Shepardson College, Granville*, \$65,000; *Hillsborough Female College*, \$6,000; *Western Female Seminary, Oxford*, \$29,500; *Lake Erie Female Seminary, Painesville*, \$32,300.

The Shepardson College sustains co-operative relations with Denison University, although there is no organic union between the two. The relation secures to the college the benefit of the libraries and laboratories of the University.

The Western Female Seminary has received during the current year three gifts of money, amounting to sixteen thousand dollars, for a new building for scientific purposes.

The catalogue of Lake Erie Female Seminary for 1887-88 furnishes the following particulars: The seminary is an outgrowth of the educational work of Mary Lyon. In 1847 a school for girls taught by graduates of Mt. Holyoke Seminary was established at Willoughby, Ohio, but after several years' successful work the building was destroyed by fire. A question then arose as to the permanent location of a school which should be more completely upon the Mt. Holyoke plan.

Liberal offers were made by the citizens of Painesville which were accepted, and in 1856 Lake Erie Female Seminary was incorporated under the general statutes of Ohio. It was opened in September, 1859, most of the teachers being graduates or former teachers of Mt. Holyoke Seminary.

The seminary offers a course of study more extensive than that of most high schools, especially adapted to the needs of women, prominence being given to history, art, and literature, while it furnishes thorough drill in languages and mathematics and gives a large place to natural sciences. The seminary is not a preparatory school to any college, but special students may pursue its courses in mathematics and the languages embracing more than is required for entrance to college, while the completed seminary course, by its breadth and thoroughness, lays the foundation for advanced special training according to university methods. The seminary course gives time for the use of the library, for essay writing, music, training in household duties, and other means of culture necessary for the complete development of woman, whether the student is to enter a profession or take her place in a home. The seminary is to its students not only a school, but a safe and pleasant home, with regular hours for sleep, exercise, and study, together with the helpful influence of a large number of resident teachers, and the companionship of young ladies of kindred tastes from different parts of the country.

While the religious teaching is unsectarian, it is the constant aim to develop character founded upon Christian principle, and to prepare for duties of Christian womanhood. The seminary illustrates the principles of Christian union in its board of trustees, its teachers, and its religious life and instruction. Six missionary societies are sustained, representing as many branches of the church, and contributing to their separate treasures; but the members of the seminary unite in Bible study, daily worship, and in the study of all movements, religious and philanthropic, for the good of the world. The location of the seminary, half a mile west of the business centre of the town, is pleasant and healthful. The grounds comprise fourteen acres, including a fine grove, and furnish abundant opportunity for exercise and recreation. The main building contains, beside eighty rooms for teachers and students, a chapel, used also for public exercises, a reception room and drawing room, a reading room, well supplied with periodicals, and open free of charge; a well selected library; a large studio for classes in drawing and painting; lecture and recitation rooms, and a gymnasium. The wing contains, in the basement, six music rooms and a laboratory for practical work in chemistry. All the teachers and students board in the seminary, and the assignment of rooms is made by the principals with regard to health and the general good. No day scholars are admitted. This is for the sake of carrying on the school work with less interruption, and especially on account of the domestic system, which admits of no privileged class, exempt from the common duties and responsibilities of the one family.

The ordinary daily housework, thoroughly systemized and lightened by many appliances for lifting weights and saving steps, is performed by the students, under the superintendence of the teachers. The time thus occupied, one hour daily, is so arranged as not to interfere with the hours of study. The economy of this arrangement was, at first, the chief consideration in the founding of Mt. Holyoke Seminary, but there are other and stronger reasons in its favor. It gives healthful exercise, cultivates a taste for home occupations, honors labor, and makes the institution not only less expensive, but more independent than it could be with the number of servants that would otherwise be required. The student sees what system, co-operation, and prompt action can do; and in time she finds herself able not only to take responsibility but to enjoy it. And thus, in future years, she will bear her part among the workers of the world with greater ease and success.

Candidates for entrance must be sixteen years of age and in good health. For admission to the regular course they are examined in—

English.—Grammar, Composition, and Rhetoric, with selected works from standard authors.

Latin.—Daniel and Collar's Beginner's Book, Jones's Prose Composition, Caesar's Gallic War, four books; Cicero, four orations.

Mathematics.—Arithmetic, through cube root, and Olney's Complete Algebra.

Physical Geography.

History.—History of the United States, Bible History, the Life of Christ.

Science.—Elements of Physiology and Hygiene.

The permanent funds, as will be seen by reference to Table 44, Column 25, amount to \$32,300.

Most of the contributions to the school have come from citizens of Painesville and Northern Ohio, but the seminary is not local in character or design. Pupils have come from twenty-six States in the Union. Many of its graduates are settled in the far West, and some are teachers in foreign lands.

If the present low rates of board and tuition are to be maintained, the seminary must rely upon the friends of education for the funds necessary to equip it completely for the increasing demands of liberal culture. There should be a permanent fund for sustaining and enlarging the departments of instruction, and for making additions to the library and apparatus, and to the natural science collections.

The Nashville College for Young Ladies, Nashville, Tenn., was opened as a private enterprise in 1880, and the following year passed into the hands of a board of trustees.

The first care of the board was the purchase of a site and the erection of a commodious and substantial building. To meet the demands occasioned by the rapid growth of the institution additional grounds were soon after purchased, by which ample space has been secured.

The arrangement and furnishing of the building show due regard to the health and comfort of students.

For scientific instruction the college is allowed access to the splendid outfit of the Vanderbilt University, which having been purchased under the personal supervision of the chancellor and the professor of chemistry in London, Paris, Berlin, and New York, is of the finest kind and of the amplest variety.

Pupils belonging to advanced classes of this institution are permitted, in company with a teacher and under proper regulations, to attend the lectures of the Vanderbilt University and to enjoy the benefits of the museum, cabinets, library, and apparatus of the same. No attempt at co-education is designed. The young ladies are taught and drilled in the texts covering the ground of instruction by their own teachers, in the class-rooms of the college. Those who attend upon lectures under this arrangement are required to take notes of the subjects discussed, to prepare recitations, and to pass written examinations before their own teachers upon the topics thus studied. By this arrangement the ample resources of the university are brought within reach of such young ladies as are properly prepared to profit by them.

In order to enter the regular collegiate course of the institution pupils are required to pass approved examinations upon the following subjects or their equivalents: Geography, arithmetic, grammar, algebra to equations, history of the United States, history of England, elementary botany, elementary physics, composition, word analysis, and spelling.

To enter the Department of Languages they must present: (1) in Latin—grammar, elementary composition, Caesar's *De Bello Gallico* (four books), and Sallust's *Cataline*; (2) in French or German—elementary grammar, pronunciation, and reading. For entrance into advanced collegiate classes the pupils must pass examinations upon the above with the topics of the intervening grades.

The Vermont Methodist Seminary and Female College was founded in 1834. The trustees are authorized and empowered to establish and confer on female pupils whom

they shall deem worthy thereof and who shall have completed the regular course of study prescribed in said college, all such literary honors and degrees as are usually conferred by the best academies, seminaries, or female colleges.

The curriculum is arranged in seven courses, as follows:

1. *Modern*, three years.
2. *Music*, three years.
3. *Art*, three years.
4. *College Preparatory*, four years.
5. *Latin Scientific College Preparatory*, four years.
6. *Latin Scientific*, four years.
7. *Collegiate*, four years.

An efficient corps of teachers is employed and high standards are maintained.

The amount of productive funds reported is twenty thousand dollars.

UNIVERSITIES AND COLLEGES OF LIBERAL ARTS.

The provision for science instruction and for a high order of technical training and the development of university foundations are the most noticeable features in the progress of superior instruction during the past decade.

The latter movement manifests itself in two directions, namely, the grouping of undergraduate, graduate, and professional schools under one charter and the extension of university courses of instruction.

For the purpose of showing the present status of this movement and of facilitating future comparative studies, Tables 45 and 46 have been added to the statistical scheme for collegiate and professional schools.

REMARKS ON TABLES 45 AND 46.

Table 45 presents in a convenient form for study the statistics of twelve foundations, comprising groups of related faculties, schools, or colleges, or engaged chiefly in the work of post-graduate instruction. Their professors number one thousand one hundred and twenty-five, and their students eleven thousand three hundred and fifty-four. A small proportion of the students ($3\frac{1}{2}$ per cent.) are in preparatory departments, reported by two of the institutions. Of the remaining students, 56 per cent. are undergraduates, 6 per cent. in graduate departments, and 38 per cent. in professional schools.

In respect to teaching staff, libraries, and all material appliances, these institutions are well equipped. The comparison of Columns 11 and 12 shows an average of one professor to ten students or less in seven cases, while in none does the number of students to a professor exceed seventeen. These ratios can not, of course, be taken as an exact measure of the available teaching force, which depends also upon the character of the instruction as determined by the subject treated and the maturity of the students. Still the numerical relation is an accepted basis for the comparison of institutions, and its favorable indications should not be overlooked.

As regards endowed professorships, the eight institutions here tabulated, which report under this head, comprise 19 per cent. of the entire number reported from all colleges of liberal arts. (*Vide* Table 47, p. 628.)

The total income of eleven of these foundations amounts to \$2,939,073, derived as follows: From productive funds, 49 per cent.; from tuition fees, 29 per cent; not specified, 22 per cent.

These foundations were favored with benefactions to the amount of \$934,232.

Table 46 presents the statistics of twenty-four State universities. These report a total of nine thousand four hundred and one students and seven hundred and twenty-nine professors. The students are distributed as follows: In preparatory departments, 10 per cent.; in undergraduate departments, 53 per cent.; in graduate departments, 2 per cent., and in professional schools, 27 per cent., leaving 6 per cent. not distributed.

The comparison of Columns 10 and 11 shows the relative strength of the universities with respect to teaching staff. In fourteen out of the twenty-four the average of students to one professor ranges from twelve to sixteen; in seven the average is less than twelve, and in three it is more than sixteen, the highest average being twenty-one students to one professor.

Omitting the University of Nevada, which makes no report under this head, the total income of the remaining State universities, twenty-three in number, amounted, so far as reported, to \$1,974,840. This sum was derived as follows:

From productive funds, 36 per cent.; from tuition fees, 10½ per cent.; from State appropriations, 38½ per cent.; from other sources, 15 per cent.

It should be observed that the departments of the universities included in Tables 45 and 46 are tabulated also in the tables to which they respectively belong. In the case of seven of the institutions in Table 45 and sixteen in Table 46, the financial particulars are identical with those reported in connection with the collegiate departments, Table 49.

In the case of the remaining universities¹, the financial particulars represent the total of items distributed in Tables 49, 55, 57, 65, 67, 69.

The Tables before us show a total of eight hundred and sixteen resident graduate students² not in professional schools reported from twenty institutions. They form 91 per cent. of all such students³ reported in colleges of liberal arts.

As regards professional schools, theology has no representation in Table 46; five schools with three hundred and seventy-two students are included in Table 45.

Of forty-nine schools of law reported from the entire country (*vide* Table 67) twenty-three are included in the two Tables before us. Their students numbered two thousand four hundred and thirteen, or 66 per cent. of all law students.

Of one hundred and twenty schools of medicine (*vide* Table 69) nineteen are included in the two Tables before us. Their students numbered three thousand and ninety, or 22 per cent. of all medical students reported.

The remaining professional students included in Tables 45 and 46 are distributed in dental, pharmaceutical, and veterinary schools.

STATE AID FOR STATE UNIVERSITIES.

State appropriations, which form the chief source of income for State universities, are affected by many conditions entirely apart from the necessities of the universities and the interests of higher education. For this reason strenuous efforts are made from time to time, by those upon whom the conduct of the universities devolves, to secure legislation that shall put the appropriations upon a fixed basis.

The following universities have the benefit of a fixed tax:

University of California, a tax of one cent on each one hundred dollars of assessed valuation; University of Colorado, tax of one-fifth of a mill on the taxable property of the State; University of Michigan, tax of one-twentieth of a mill; University of Nevada, tax of one-half of a mill on the dollar of taxable property.

"The General Assembly of Indiana passed an act in 1883 providing for the permanent endowment of the university by the levy of a tax of one-half per cent. on each one hundred dollars of taxable property, to be collected annually for thirteen years. This fund, it is estimated, will amount to about three-quarters of a million dollars at the end of thirteen years, producing an annual income equal to that now received from all other sources."

The regents of the University of Iowa urge the Legislature to cause a tax of half a mill to be levied on the taxable property of the State for the creation of a permanent fund for the university.

The board of curators of the University of Missouri are seeking permanent provision in order that the university may be removed from the "pale of politics" and the Legislatures relieved from "constant importunity."

The trustees of Ohio State University ask for a tax of "one-twentieth of a mill on the grand duplicate of the State."

¹ Viz: Boston University, Harvard, Yale, University of Pennsylvania, De Pauw University; and the following State universities: Colorado, Iowa, Kansas, Mississippi, Nevada, Ohio, Tennessee, Wisconsin.

² The number does not include eighteen post-seniors and twelve students in the post-graduate course in law at the University of Pennsylvania.

³ In this estimate seventy-five post-graduate students who do not appear to be pursuing courses in advance of the usual college curriculum have been omitted from the sum total.

GROWTH AND PRESENT STATUS OF UNIVERSITIES AND COLLEGES.

The following is a statement of the aggregate number of universities and colleges, with instructors and students, as reported to this Bureau each year from 1878 to 1888, inclusive (1883 omitted):

	1878.	1879.	1880.	1881.	1882.	1884.	1885.	1886.	1887.	1888.
Number of institutions.....	359	364	364	362	365	370	365	345	361	357
Number of instructors.....	3,885	4,241	4,160	4,361	4,413	4,644	4,836	4,720	5,266	4,834
Number of students.....	57,987	60,011	50,594	62,435	64,096	65,522	65,728	67,642	70,024	75,333

Table 47 presents the summarized statistics of three hundred and fifty-seven colleges having a total of seventy-five thousand three hundred and thirty-three students and four thousand eight hundred and thirty-four professors.

Thirty-six per cent. of the students are in preparatory departments reported from two hundred and fifty-seven colleges. Forty-four colleges do not report the classification of their students, and fifty-six, or 16 per cent., are engaged solely in collegiate work. In this small proportion are comprised a little more than one-third of the college students of the country. The North Atlantic Division shows the largest proportion of colleges in this category.

Two hundred and fifty-eight colleges report productive funds to the amount of \$60,318,481. Thirty-five had the benefit of State or municipal aid to the amount of \$1,225,590. The total income, viz, \$3,885,515, representing three hundred and seven colleges is derived as follows: From productive funds, 39 per cent.; from State aid, 14 per cent.; and from tuition fees, 28½ per cent.

From an analysis of details given in Table 49 it appears that, considering attendance, the number of colleges reporting one hundred or more students in collegiate departments is one hundred and eighteen.

If colleges thus reported are divided into four classes, viz, those having from one to two hundred collegiate students; from two to four hundred; from four to eight hundred; and above eight hundred, the following is found to be their distribution, considering the country by geographical sections:

Number of Colleges Reporting Collegiate Students.

Division.	100 to 200.	200 to 400.	400 to 800.	Above 800.	Percent- age of total col- leges.
North Atlantic.....	25	11	4	1	66.13
South Atlantic.....	14	2	34
South Central.....	15	3	27.27
North Central.....	23	12	3	24.36
Western.....	3	2	19.23

The following tabulation shows the limits of the number of college students to one college professor in the four classes of colleges here considered, so far as they have supplied the data:

Lowest and Highest Number of College Students to One College Professor.

Division.	College Students 100 to 200.		College Students 200 to 400.		College Students 400 to 800.		College Students above 800.	
	No. of Col- leges.	Students to one Professor.	No. of Col- leges.	Students to one Professor.	No. of Col- leges.	Students to one Professor.	No. of Col- leges.	Students to one Professor.
North Atlantic.....	20	5-22	6	4-46	3	12-17	1	13
South Atlantic.....	6	3-21	2	21-66
South Central.....	9	8-27	1	12
North Central.....	10	7-20	7	9-22	2	14-24
Western.....	3	9-25	1	20

Table 48 shows the distribution of the college students in classical and scientific courses so far as reported to this Office for the successive years from 1882-83 to 1887-88, inclusive.

The inquiries for the last two years have been somewhat more specific than in the years preceding, for which reason, as will be seen, three additional columns are required for the tabulation relating to them. Considering the entire period of time it will be seen that the North Atlantic Division is the only one from which the particulars have been reported with sufficient fullness to justify comparisons. Here there appears to be a slight increase in the proportion of students following the classical course.

The tabulation, it is hoped, will serve the purpose of eliciting fuller replies in the future to the inquiries bearing upon this discussion.

The detailed view of the colleges reporting to the Office for the present year is presented in notes and extracts drawn from current catalogues, reports, and other official sources, and in the statistics reported to the Office for the present year.

In the arrangement of the text the same order has been observed as in the arrangement of the tables, matter relating to the institutions included in Tables 45 and 46, preceding in each case notices of other colleges in the several States.

ALABAMA.

University of Alabama.—The following information is derived from the catalogue for 1887-88 and from other sources:

The endowment of the University of Alabama dates back to 1802, when the State of Georgia ceded to the General Government the territory which now comprises the State of Alabama. In the act of cession all the provisions of the Ordinance of 1787 regarding education were made applicable to this territory. Congress recognized the condition of this grant, and in the act for the admission of Alabama into the Union, approved March 2, 1819, reserved for the use of such seminary seventy-two sections of the public lands in the State to be "appropriated solely for the use of said seminary." The lands were designated in the land offices on the maps of the Government survey as the "university lands," and were the richest in the State. The acceptance of this trust by the State for the benefit of the university was made one of the conditions of Alabama's admission into the Union. The Constitution of 1819 made provision for the fulfillment of the obligations under the trust, as has every subsequent Constitution, including that under which the people now live.

The lands referred to were finally sold by the State and the proceeds, between seven and eight hundred thousand dollars, paid into the State treasury. The State in 1859 arbitrarily fixed the amount at three hundred thousand dollars, and assumed the payment of the interest annually.

The recent building operations have greatly increased the facilities of the university, and especially those of the scientific department.

An act was passed by Congress and approved April 23, 1884, devoting 46,080 acres of public lands in Alabama to the State for the benefit of the university.

The grant was accepted by the State, and all of the lands have been located in the mineral district. They are very valuable, and are estimated to be worth over half a million of dollars.

This generous donation of the Federal Government has enabled the university to make extensive improvements.

The president, Dr. H. D. Clayton, furnishes the following particulars as to progress made since June 30, 1887. As regards,

First. Buildings.

The following have been furnished and fitted as described:

Garland Hall, an L-shaped building three stories high completing the quadrangle. The first floor is fitted up and used as a geological museum.

The chemical laboratory, a two-story building, 40 by 60 feet, with a one-story wing 30 by 70 feet. About five thousand dollars have been expended in fitting up and supplying the interior with furniture and apparatus.

The physical laboratory, a counterpart of the chemical laboratory, having, like that, a one-story wing 30 by 70 feet. This contains a well-equipped gymnasium.

Five houses for professors' residences. These are two-story buildings, having eight rooms each and provided with suitable outhouses.

A laundry, 40 by 70 feet, with basement for boiler and machinery.

A gymnasium building, 30 by 70 feet, now being fitted up with suitable apparatus.

A brick fire-proof vault for a safe-keeping of records and papers.

A bath-house covering a clear pool twenty feet in diameter in cement walls, and a bath-room for hot and cold baths.

Second. Water-works and other improvements.

A complete system of water-works, by which pure spring water is supplied to every floor of all the buildings surrounding the quadrangle.

A complete system of sewerage extending to the Warrior River, affording drainage from mess hall, closets, and all the buildings.

A substantial and ornamental iron fence eleven hundred feet long, extending along the front of the campus.

A dairy has been added to the boarding department, the necessary quantity and best quality of milk thereby better secured.

Third. Scholastic resources.

A chair of history and a professor elected to the same.

Three thousand volumes have been added to the university library, which has been handsomely fitted up with alcove and a gallery running the whole length of the hall.

A law library of twelve hundred well-selected law books and law literature.

Spring Hill College occupies a fine site five miles from Mobile, and one hundred and fifty feet above the sea level. The plan of instruction embraces three principal courses: The preparatory of one year's duration, the classical of six years, the commercial of four years. The degree of A. B. is conferred upon students who complete the classical course and pass the required examinations. An additional year of philosophy at the college attended with success, or two years' practice in a learned profession, entitles to the degree of A. M.

ARKANSAS.

Little Rock University, chartered in 1883 under the auspices of the Freedmen's Aid Society of the Methodist Episcopal Church, affords an interesting illustration of the agencies by which learning is fostered in sparsely settled, developing communities. It is an institution for white students, comprising primary, secondary, normal, art, collegiate, and professional departments. The tuition fees are very low, aid is extended to indigent students, and every encouragement is given those who endeavor by their own labor to defray the expenses of their education.

Women are admitted to the college, and it is proposed to establish at an early date a home for girls, under the auspices of the Women's Home Missionary Society, in which ample provision will be made for a school of domestic economy.

Naturally, in the present stage of the institution, the collegiate work is small, comprising in 1887-88 only 7 per cent. of the students.

The plans for the preparatory course indicate the purpose of making this a strong and vigorous feeder for the college.

The law school has been in active operation for several years under the name of the Little Rock Law Class. The lecturers are distinguished jurists whose services are freely rendered. For the present no charges are made to the students, who represent eight per cent. of the entire enrolment of the university.

The university has a valuable property in grounds and buildings.

The Freedmen's Aid Society of the Methodist Episcopal Church also has under its auspices Philander Smith College for the colored race.

CALIFORNIA.

University of California.—In 1887 Dr. Ed. S. Holden resigned the presidency of the University of California, Berkeley, which he had held for two years, to assume his duties as director and chief astronomer of the Lick Observatory.

On the 23d of March, just twenty years from the day on which the law establishing the university was passed, Dr. Holden's successor, Horace Davis, was inaugurated.

Naturally the event became the occasion for recalling the high purposes which were impressed upon the university at the outset, and for reviewing the work accomplished.

In his address on behalf of the faculties, Prof. Martin Kellogg reminded his hearers that the old College of California had maintained a high standard of classical training before it was merged into the university, and when it lost its separate existence "it obtained a guarantee for a classical course equal in grade to the courses of the best Eastern colleges."

Side by side with this classical course the university has maintained the science and technical courses of recognized excellence, while, as pointed out by President Davis, students who care for neither classical training nor technical knowledge may avail themselves of "the literary course, which affords a generous education in English literature and the modern languages, fitted to make broad-minded, cultivated men and women." Of this course President Davis said in his inaugural address: "The proof that it meets the needs of the time and place is the number of students following the course, larger than those pursuing any other branch of study in the undergraduate department."

The Lick astronomical department added during the year will be an element of strength to the university and can not fail to increase its renown.

The director has assurance of five thousand dollars. The working force numbers beside himself four astronomers and one assistant astronomer.

By the action of the Legislature, February 14, 1887, the university is freed from the evils of uncertain income. On that day the bill was passed providing for the levy on each hundred dollars of taxable property in the State a tax of one cent for the support and improvement of the State University. It is estimated that the revenue thus assured will amount to about seventy-five thousand dollars, with the prospect of speedy increase to one hundred thousand dollars annually. Together with the previous endowments of the university it gives an immediate income of above two hundred thousand dollars, surpassed by six institutions only of the entire number included in Tables 45 and 46.

The College of California, which was merged into the university, began its work in

1860. Including the alumni of this college, the university now numbers five hundred and fourteen graduates exclusive of those from the professional schools.

Pierce Christian College, College City, was founded and partially endowed by funds arising from the sale of land given to the Christian Church by the will of Andrew Pierce, Esq. The institution is entirely out of debt; the original endowment has been considerably increased by the gifts of its friends and there is promise of still further additions.

One peculiar feature of the place is that no intoxicating liquors are sold, and no gambling houses are allowed in the village or on the estate. Every deed given to any part of the estate, formerly belonging to the college, includes a clause prohibiting the traffic in spirituous or malt liquors. To make the clause more effective, the friends of the school procured the passage of a bill by the Legislature prohibiting the sale of liquors within one mile of the college.

Civil engineering has been taught in the college for the last two years, and now a full course has been arranged, leading to the degree of civil engineer.

The buildings were enlarged during the summer of 1887.

Napa College, Napa City, was chartered June 5, 1885, "to provide an institution of higher learning, where young men and women may receive a complete scientific, literary, and classical education." It is under the supervision of the California Annual Conference of the Methodist Episcopal Church to insure Christian direction; but it is not sectarian in its teachings nor requirements.

The facilities and accommodations of the college have been greatly increased during the past year, about eleven thousand dollars having been expended in the work.

As less than three years have elapsed since the institution received its charter, the work in the college courses has only begun.

The endowment of *The Leland Stanford Junior University, Palo Alto*, was noted in the Commissioner's Report for 1884-85. On the 14th of May, 1887, the corner-stone of the university building was laid with appropriate ceremonies.

Work upon the same is being pushed as rapidly as is possible for such an undertaking, and it is designed to have the ceremonies of dedication take place on the 14th of May, 1889, the twenty-first anniversary of the birth of Leland Stanford, Jr.

COLORADO.

The University of Colorado, Boulder, owes its endowment to the combined action of private individuals, Congress, and the State Legislature.

The catalogue for 1887-88 gives the following summary of the early action in its interests:

The University of Colorado was incorporated by an act of the Territorial Legislature of 1860, and the location fixed at Boulder. In 1871, three public-spirited citizens donated to the University fifty-two acres of land adjoining the city, valued at five thousand dollars. In 1874 the Territorial Legislature appropriated fifteen thousand dollars, and the citizens of Boulder contributed a like sum in cash. In 1875 Congress set apart and reserved seventy-two sections of the public lands for the support of the State University. In 1876 the Constitution of Colorado provided that upon its adoption the university at Boulder should become an institution of the State, thus entitling it to the lands appropriated by Congress, and further made provisions for the management and control of the university. The first General Assembly of the State made provision for its permanent support by a levy of a tax of one-fifth of a mill upon the property of the State; also for a fund to be secured by the sale of lands donated by the United States.

The cabinet and laboratory equipments of the university are excellent. Its library was founded by C. C. Buckingham, of Boulder. The regents have appropriated one thousand dollars for additions to the library during the present year, which sum has been increased to twelve hundred dollars by the liberality of Mr. Buckingham.

CONNECTICUT.

Yale University.—In his report for the year ending July 1, 1887, President Dwight calls attention to the change that has taken place in the official relations of the president on account of the development of the various schools now forming the university. "In consequence of this development," he says, "it has become very desirable, and even necessary, that the one who fills the office of president should no longer be, as heretofore, an officer and instructor in the collegiate department only, with secondary and almost nominal relations to other departments, but a member of every faculty, having equal interest in the work and life of every branch of the university. With a sense of the importance of this change in the official relations of the one who presides, the president, immediately on beginning his work, gave his attention to the affairs of all departments, and considered it his duty and privilege to be present at the meetings of the several faculties as well as to co-operate with them as far as possible in promoting the welfare of the schools under their special charge. The advantage of such meetings and

co-operation has already been manifest, it is believed, in the greater unity of the institution, and in the confidence on the part of all that the several sections of the university are to grow in harmony towards the more perfect development of the university life. The demand made upon the time and thought of the president by this great enlargement of his official duty deprives him of the opportunity of meeting the students in the lecture or recitation room as frequently as his predecessors were able to do. The impossibility referred to was so appreciated by the corporation at the time of the election of the new president that a vote was passed releasing him from all obligation to give instruction in the academical department."

Under the conviction, however, that the president of a university should not be "simply a man of affairs," but should, in some way, "come into intellectual contact with the members of the student community," President Dwight gave instruction in the theological department in 1837, meeting the students four or five times a week, and proposed for the present year, viz, 1838, to meet the academical students in the lecture room at least once a week.

In the same report President Dwight says: "The provision for the teaching force in the university is the most central and important thing in the university life. Those who have graduated at Yale College, and all who are interested in its welfare and its future, may fitly be asked to consider its needs in this regard."

Among measures affecting the scholastic work of the department of philosophy and arts, the president notes in his report for 1837 the following: In the requirements for admission to the Freshman class in the college the amount of Greek and Latin, which was diminished somewhat a few years since in consequence of a provision with respect to modern languages not previously enforced, is by vote of the corporation to be made the same as in earlier years after the year 1837. The requirements in Latin will include four books of Caesar's Gallic War instead of three, and in Cicero, in addition to the orations against Catiline and for Archias, either the Marcellus and the Fourteenth Philippic, or the Milo, or the Manilian Law, or the Cato Major; and in Greek they will include four books of Xenophon's Anabasis, instead of three, and three books of Homer's Iliad, instead of two.

In May, 1836, Prof. William R. Harper was appointed to the professorship of Semitic languages, and began his work in the same the following September, offering courses in Hebrew, Assyrian, Arabic, and Aramaic. These courses awakened great interest, and in connection with them so much duty was imposed upon the professor, that, in view of the demands already made upon his time, and the greater ones which seemed likely to arise in the coming year, a friend of the university generously offered to provide the means for paying the salary of an assistant in these branches of study during the year 1837-38. Dr. Robert F. Harper was selected for this position. The foundation for this professorship of Semitic languages has been, as yet, only partially secured. It is hoped that the endowment may be soon completed in order that this professorship may rest upon a permanent basis.

The courses offered in political science were also enlarged in 1837. The three gentlemen who were appointed lecturers in connection with these courses for the year specified, Mr. Edward V. Reynolds, Mr. Henry C. White, and Mr. Edward G. Browne, were invited to continue their work during 1837-38.

In the spring of 1837 a special course of lectures on protection was given to the students by Prof. R. E. Thompson, of the University of Pennsylvania, for which provision was made through the generosity of several friends of the university.

In the report from which the foregoing particulars are derived, viz, that for the year ending July 1, 1837, President Dwight makes mention of the following new buildings, completed or in progress, for which the university is indebted to generous friends: Dwight Hall, a building erected for the religious interests of the university, and for the Christian work of the young men among themselves, was completed and consecrated in the fall of 1836. The opening of the college year 1836-37 also witnessed the completion of a new dormitory building named in commemoration of Mr. Thomas G. Lawrence, a member of the college class of 1834, who died soon after the beginning of his senior year. The gift of fifty thousand dollars for this building was offered to the college by the mother of Mr. Lawrence, and the building itself was very nearly completed before the close of Dr. Porter's administration.

To the history of the same administration belongs, also, the provision for the Kent laboratory. Mr. Albert E. Kent, of the college class of 1853, offered seventy-five thousand dollars for the purpose of providing for the college a new chemical laboratory, which sum was placed in the hands of the treasurer, partly before and partly after the beginning of the college year 1836-37. Unavoidable delays, however, prevented the beginning of the work of erecting the building until late in the spring of 1837. It is expected that it will be ready for occupancy early in 1838.

In January, 1887, Hon. Simeon B. Chittenden, of Brooklyn, N. Y., offered to give one hundred thousand dollars for the purpose of providing a new building for the University Library, which may furnish additional accommodation for the constantly increasing demands of the library, while the present building shall remain, and may ultimately be a part of an extended building, or pile of buildings, devoted to the University Library of the future.

In accordance with the terms of this gift, the largest ever made for the University Library, plans have been completed and the work of building begun.

In the summer of 1887 another generous friend offered the sum of at least one hundred and twenty-five thousand dollars for a building to be used for lecture and recitation rooms. The benefactor who proposes to provide this building desires to make it one of the finest in its architectural effect on the college square, and to have it occupy the most conspicuous site.

The work of building has begun, and will be completed at as early a date as practicable.

Trinity College, Hartford, while maintaining the standards that have characterized it in the past, has made due provision for the demands that are peculiar to the present time. In 1884 three new courses were established, two of which lead to a degree in science. Electives were also introduced in the junior and senior years of the several courses.

The college is distinctively Christian in its character. The first recitation on Monday morning throughout the college is devoted to religious studies. These comprise the following subjects: The New Testament in Greek; Old and New Testament History and Biblical Literature; Natural Theology; The Foundations of Religious Belief; The Evidences of Christianity; The Historical Coincidences and Evidences of the Holy Scriptures.

The new gymnasium was completed in 1887 and the Jarvis Hall of Science the present year. The building and equipments have cost upwards of fifty thousand dollars, which have been contributed in various sums, ranging from five to thirty thousand dollars.

Wesleyan University, Middletown, has neither professional nor technical departments, its resources being applied solely to the maintenance of a college of liberal arts.

From 1873 to 1886 the course of study remained without change, except in unimportant details. In the latter year the board of trustees gave their approval to a recommendation of the faculty looking to a revision of the curriculum. The principal objects aimed at in the revision as set forth in the University Bulletin are as follows:

(1) The introduction of modern languages and natural science at an earlier period of the course—a change rendered possible by a slight reduction in the amount of required Latin, Greek, and mathematics.

(2) The bringing of the requirements for admission to the Latin-scientific and scientific courses more nearly to an equality with those for the classical course, by including in the requirements for the former courses a knowledge of French or German.

(3) The re-arrangement of the curriculum with a view to bringing (so far as practicable) each study common to all three of the courses into the same year.

(4) A slight diminution of the amount of class-work required of the seniors, in order to allow more leisure for special-honor work and other forms of collateral study.

As now constituted the curriculum may be taken to illustrate the prevailing conception of the proper scope of college training. For this reason a somewhat extended outline of the several courses, as given in the catalogue for 1887-88, is here presented:

The college presents to its undergraduate students the option of three parallel courses of study, each extending through four years, and named respectively the classical course, the Latin-scientific course, and the scientific course.

In the classical course the study of Latin and Greek forms a large part of the required work of the first two years. In the Latin-scientific course Greek is omitted, and in the scientific course both Greek and Latin, in order to give more extended opportunity for the study of modern languages, science, and literature.

Required and elective studies.—In each of the above courses all of the studies of the first year are required, except that the classical and Latin-scientific students have the option between French and German. In the three remaining years the amount of required work is progressively diminished, the student being allowed to complete his quota by selecting from a wide range of elective studies.

In the choice of these electives the student is advised to exercise prudence and deliberation, and especially to regulate his choice so that his electives will together form a harmonious and symmetrical course of study; and in no case is a student allowed to select a study which he is not, in the judgment of his instructors, qualified to pursue with advantage.

The following is a tabulated view of the distribution of required and elective studies in the three courses:

	Classical Course.		Latin-Scientific Course.		Scientific Course.	
	Required.	Elective.	Required.	Elective.	Required.	Elective.
Ancient languages.....	22	20	7	12
Modern languages.....	14	16	14	13	13	4
Rhetoric and English literature.....	4	11	4	12	4	12
Logic, psychology, and ethics.....	8	8	8	8	8	8
History and political and social sciences.....	5	8	5	8	5	8
Mathematics.....	9	8	9	8	2	9
Physics and astronomy.....	8	20	8	21	8	21
Chemistry.....	3	12	4	12	4	17
Biology.....	3	15	6	12	6	13
Geology, mineralogy, and physical geography.....	4	10	5	8	5	8
Percentage of work required of each student in four years.....	70	60	55
Percentage of elective work.....	30	40	45

^aOption is allowed between French and German. If these should therefore be counted as elective, the percentage of studies required in the classical and Latin-scientific courses would become 66 and 56, respectively.

The distribution of the required and elective work in each of the four years is shown in the following table:

Year.	Classical.		Latin-Scientific.		Scientific.	
	Required.	Elective.	Required.	Elective.	Required.	Elective.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
Freshman.....	84	16	83	17	100	0
Sophomore.....	84	16	53	47	69	31
Junior.....	53	47	53	47	17	83
Senior.....	28	72	28	72	23	77

^aOption between French and German, one of which is required.

DISTRICT OF COLUMBIA.

The Columbian University.—The Columbian College, a department of the university of the same name, has its course of instruction arranged in seven schools. These are so grouped as to form three courses, leading respectively to the degrees of bachelor of letters, bachelor of science, and bachelor of arts.

The candidates for the first named must obtain diplomas in the schools of English, Greek, Latin, modern languages, and philosophy, and receive a certificate of proficiency in the school of mathematics or of natural science.

For the degree of bachelor of science candidates must obtain diplomas in the schools of English, modern languages, mathematics, natural science, and philosophy.

For the degree of bachelor of arts diplomas must be obtained in any six schools, and a certificate of proficiency in the remaining schools of the entire course.

The Corcoran Scientific School, established by the trustees and overseers of the Columbian University as a part of their university system of education, is called by the name of W. W. Corcoran in respect for his exalted character and in grateful recollection of his many benefactions to the university.

Provision is made in this school for general and for special courses of study.

The former embraces schemes of studies in literature, science, and technology, leading respectively to the degree of bachelor of science, of civil engineer, mechanical engineer, mining engineer, etc., according to the scope and quality of the studies prescribed for each degree.

Under the head of special courses of study, whether considered with reference to single studies or to arts embracing with specific studies a certain component part of the general course, provision is made for instruction in practical astronomy, geodesy, electrical engineering, architecture, analytical chemistry in all its branches, metallurgy, assaying, drawing in all its branches, etc.

To accommodate students engaged in the Executive Departments or in other work the exercises of the school are held in the evening, from 6 to 10 o'clock.

The Catholic University of America.—For the following account of the Catholic University of America the Office is indebted to one of the directors of the same. This latest but not least of America's universities was originated in the third plenary council (Catholic) of Baltimore in the year 1884. It is the realization of the most earnest wish of the hierarchy and laity of the church in America, as expressed in previous councils and in the highest Catholic thought for years. The desired consummation was brought about at this time by the providential and munificent gift of Miss Mary Gwendolen Byrd Caldwell, offered to the bishops of the above-named council for the founding of a Catholic university in the United States. The council, after mature deliberation, accepted the offer, and pledged itself to the establishment of such an institution as soon as possible. Washington, D. C., was chosen as the most suitable location, and accordingly a site was soon selected alongside of the Soldiers' Home park, a few miles distant from the centre of the city. The cornerstone was laid in the presence of an immense concourse of people, among whom were the highest representatives of church and State, by His Eminence Cardinal Gibbons, of Baltimore, on May 24th, 1888. The building, an immense granite structure 266 feet long, with two return wings 56 feet by 45 feet, and a pretty chapel in rear of the centre section, is rapidly advancing to completion, and is expected to be roofed by January, 1889. This great progress on the work will allow the opening of the Divinity Hall for students in November, 1889, according to the announcement of the directors. The other departments of science, medicine, literature, law, etc., will be added immediately to that of divinity. The university will not be a mere college, but its course of studies will be post-graduate in all its departments, giving the highest education, the fullest intellectual development to clergy and laity in their chosen callings. The Catholic Church in founding this new university proposed to establish a perpetual institution, not merely to uphold and strengthen the law of God, the Creator and Redeemer of the human race, but also to shed lustre on religion, by supplying it with proofs, clearer and clearer every day, drawn from sacred and profane learning, and the successive discoveries resulting from investigations by men of genius. And, furthermore, the university is intended to furnish young men with such training in mind and character as will best qualify them to contribute in the capacity of citizens to the honor and defence of their country.

The board of directors is composed of the following distinguished gentlemen: James (Cardinal) Gibbons, archbishop of Baltimore; John J. Williams, archbishop of Boston; P. J. Ryan, archbishop of Philadelphia; M. A. Corrigan, archbishop of New York; John Ireland, archbishop of St. Paul; John L. Spaulding, bishop of Peoria, Ill.; John J. Keane, bishop of Richmond; Martin Marty, bishop of Dakota; C. P. Maes, bishop of Covington, Ky.; John S. Foley, bishop of Detroit; Killian C. Flasch, bishop of La Crosse, Wis.; John M. Farley, domestic prelate, New York; P. L. Chappelle, D. D., Washington; Thomas S. Lee, rector of the Cathedral, Baltimore; Eugene Kelly, New York; Michael Jenkins, Baltimore, and Thomas E. Waggaman, Washington, D. C.

Cardinal Gibbons is president of the board; Mgr. John M. Farley is secretary; Eugene Kelly is treasurer; Right Rev. John J. Keane, D. D., is rector of the university, and Rev. Philip J. Garrigan, D. D., is vice rector. The university was incorporated November, 1885.

Georgetown College.—The centennial of Georgetown College will be celebrated February 20, 21, and 22, 1889. The near approach of this interesting event gives special interest to a historical review of the college for which the Office is indebted to J. F. Dawson, S. J.

The account will be embodied in the forthcoming monograph on the history of education in the District of Columbia. It is proper to note here that the first building of the college was erected in 1789, and the first president, Rev. Robert Plunkett, entered upon his duties in October, 1791.

May 1, 1815, Congress gave the college a university charter giving it power to confer degrees in all the faculties. The medical department was established in 1851 and the law department in 1870.

The curriculum of the college agrees in its arrangement and scope with that of many Catholic colleges of the country.

The following statement, taken from Mr. Dawson's paper, shows very clearly the conception of intellectual discipline and development upon which the curriculum is based:

"The present course of studies at Georgetown is that generally pursued in the colleges of the Society of Jesus, and, including the preparatory department, extends over a period of seven years. The plan of studies is based on the idea that a complete liberal education should aim at developing all the powers of the mind, and no one faculty at the expense of the others. During the first part of the course the memory receives the principal share of attention, the student being engaged in mastering the rudiments of Latin, Greek, and mathematics, and in acquiring accuracy in the use of his native tongue. As the pupil advances the judgment is more and more exercised, by means of translations

from one language into another, and by the study of mathematics, while less attention is given to mere memory work. When the student is able to read Latin and Greek with some facility, he devotes himself for a year to the cultivation of his literary taste, by reading the best models of ancient and modern literature. The following year is given to the training of the imagination; the nature of poetry is explained, the technicalities of verse-making are mastered, and the great poets are carefully studied. Then comes the year of rhetoric, during which the student's critical powers are exercised and developed; poets and prose writers are scientifically analyzed, the principles of oratory are carefully examined, and the speeches of the world's greatest orators are read and discussed. The last year of the course serves to discipline the reasoning faculties by the study of logic, metaphysics, and ethics, and by continuing mathematics and natural science, which were already begun in preceding years. During this year great attention is given to metaphysics, and a thorough knowledge of it is regarded as of the utmost importance, since it serves to arrange all the student's knowledge systematically, and gives him the ability to grasp firmly the principles of any special study to which he may wish to devote himself.

"This course is calculated to develop and train all the powers of the mind, rendering it able to understand and appreciate all branches of learning. It serves as a foundation for special training in any branch which the student, with his mind matured and trained, may decide to take up.

"The same course is obligatory on all; to render it elective would be to defeat its very end and aim, for the student, before his mind is developed, cannot judge what studies will be most beneficial to him.

"While adhering to her ancient principle with regard to the method of her training, Georgetown College has kept pace with the times in adopting new branches of study or developing old ones, as the changes of the age require. She watches these changes with a keen eye, and while jealously guarding the stores of the past, she will not suffer her students to be deprived of the more glittering treasures of modern culture. Whatever is important in natural science is taken into her courses and taught with a philosophical analysis intended to guard the student against that confounding of mere information with learning, which is the danger of modern education. Physics, mechanics, general and analytical chemistry, and geology, all form important parts of the regular obligatory course of studies. Physics and chemistry are the subject of laboratory instruction. Observation and investigation in natural history are encouraged by a scientific society among the students and by the Toner medal. As yet there are no professional schools of natural science in the university, instruction in these branches being only that which is supposed to be desirable for the completion of a perfect general education, such as a highly cultured man of any profession would wish to possess.

"As soon as the means of the university permit, she will establish professional schools of the various branches of science."

Gonzaga College has an interesting history, dating back to 1826, when it was known as "Washington Seminary" and enjoyed a high reputation as a classical school. The present name was first used in 1848.

The college became so prosperous that it even aspired for a while to the rank of a university. During the last quarter of a century it has experienced various vicissitudes. It is at present in a prosperous condition. The course of studies in the regular college curriculum supposes a period of seven years, but this period is often shortened by a year or two when the quickness or the industry of the student warrants the faculty in advancing him for his literary merit.

Departments are also maintained for the pursuit of the studies that are deemed best fitted to prepare students for commercial life.

The National Deaf-Mute College is the only institution in the country where the deaf can secure collegiate training. It makes provision for thorough instruction in the essentials of a liberal education without attempting to do the work of the polytechnic schools on the one hand or that of the university on the other. The course of higher instruction leading to collegiate degrees occupies four years and embraces courses in (1) languages, ancient and modern; (2) mathematics; (3) natural science; (4) history, and (5) philosophy and political science.

Prior to 1887 several applications for admission had been received from young women, and it was urged from influential quarters that there was injustice in excluding them from the privileges they sought. After careful consideration it was determined to open the college to women for two years as an experiment.

No suitable accommodations for them being available, the president offered to give up the use of the greater part of his residence for this purpose, providing a home for his family elsewhere.

Six young women, representing the States of Illinois, Pennsylvania, Maryland, Nebraska, and Indiana, presented themselves early in 1887, and were admitted to the introductory class of the college.

DAKOTA.

The University of North Dakota, Grand Forks, received its charter in 1883 and was opened for the reception of students in 1884.

Four college courses are offered, viz: The course in arts, the course in science, the course in letters, and the normal course. In the absence of suitable fitting schools in the Territory from which the patronage of the university must chiefly be drawn, it has been found necessary to provide instruction temporarily in subjects preparatory to those pursued in the university proper. The work of this department is entirely foreign to the scope of a true university, and it is strongly urged upon the high schools of the Territory that they prepare themselves as speedily as may be to relieve the university of all instruction of a preparatory nature.

The university has no income other than the Territorial Legislature appropriation, which is made biennially. In the session of 1887 the appropriations were as follows: For professors' salaries for two years, twenty-five thousand dollars, there being at the time an unexpended appropriation of a former Legislature to the amount of five thousand dollars; for museum, library, physical, chemical, and scientific apparatus, fuel and lights, engineer, fireman, janitor, and incidentals, thirty-one thousand dollars. The secretary of the board of regents is paid in addition by the Territory twelve hundred dollars a year.

The studies of all regular students, except those in the normal department, are identical during the three preparatory years, and also during the Freshman year. Differentiation begins at the beginning of the Sophomore year, at which time the students elect among the three courses.

The president, Homer B. Sprague, writes as follows: "We differ, I think, from all other American institutions in requiring one (and only one) year of Greek in preparation for every course except the normal. That is, all regular students, except the normal, must take a year of Greek; but the non-essentials in Greek are omitted."

The University of Dakota, Vermillion, was made the subject of legislation as far back as 1862, when it was located at Vermillion. In 1881 seventy-two sections of land were granted to Dakota, selected, and withdrawn from sale as directed and approved by the Secretary of the Interior, "for the use and support of a university in the Territory when it should be admitted as a State in the Union."

In the spring of the same year persons interested in the cause of education met at Vermillion and formed an association for the erection of a building to be used for university purposes.

At a special meeting held by the voters of Clay County, March 13, 1882, it was voted to raise the sum of ten thousand dollars to aid in the construction of the university building, and also to build one of Sioux Falls granite, 48 by 62 feet, two stories high. This, which is now the west wing, was erected with the proceeds of the Clay County bonds.

This liberal act was the year after the total destruction of Vermillion by the great flood of 1881.

In 1883 the university received its charter, and in September of the same year began its work.

The university building is a fine structure of Sioux Falls granite. The grounds comprise twenty acres, the gift of Hon. J. P. Kidder and Hon. M. J. Lewis.

A good beginning has been made toward supplying a library and scientific apparatus suitable for an institution of high grade.

The departments of the university are preparatory, normal, collegiate, musical, and commercial. The collegiate offers three parallel courses,—the classical, the literary, and the scientific. Its first class graduated June, 1883.

GEORGIA.

The University of Georgia, Athens, comprises the academic department known as Franklin College, the State College department, law and medical departments, and four branch agricultural colleges in different sections of the State.

The three first-named departments are situated at the ancient site of the university in Athens; the medical department is in Augusta.

Franklin College offers three courses leading respectively to the degrees of B. A., B. S., and B. Ph. The course for each degree is prescribed, the student having only the privilege of choosing the degree for which he will study.

The State College offers courses in agriculture, engineering, and applied chemistry. All

students of the State College and of Franklin College, unless exempted by the faculty, are required to take part in the regular military drills, which are conducted thrice in the week.

The students have access to the college library, containing above thirteen thousand volumes; to the Gilmer library, a collection of about one thousand volumes, bequeathed to the university by Gov. George R. Gilmer, and to two society libraries.

As regards facilities for science instruction, the university is not excelled by any institution of the South.

The laboratory presented to the State College by the city of Athens is a building of three stories and basement, having a ground plan of 100 by 50 feet. Its cost was twenty-five thousand dollars.

In 1881 Hon. Joseph E. Brown established at the university, in memory of his son, an endowment known as the Charles McDonald Brown Scholarship Fund. This is a fund of fifty thousand dollars, the interest of which is to be loaned, under specified conditions, to worthy young men, who unaided could not acquire a liberal or professional education.

Bowdon College, Bowdon, is situated in a forest country thirty-six miles from any railroad.

It represents an endeavor to bring the means for advanced instruction within the reach of the humbler classes, and all expenses are placed at a very low figure.

Young men and women are admitted on the same terms.

Emory College, Oxford, is one of the best known colleges of the South.

In addition to the college, classical, and scientific courses, it maintains a department of book-keeping, a school of telegraphy, and a school of technology, which offer unusual advantages to those who desire preparation for practical business life.

In order to cheapen the expenses of living for worthy, ambitious young men, who must work their way through their course of study, the college, so far back as 1876, began in a little six-room cottage, the experiment of procuring cheap board for those who needed it. In the fall term of that year ten young men began housekeeping in the rented house. For three years the experiment was conducted in that cottage. The results proved conclusively that cheap and good board was in the reach of poor boys, and that in health, morals, social standing among students and citizens, and in scholarship, the hall boys ranked with the best. As a consequence the accommodations were increased and now comprise the largest and best house in Oxford.

From the beginning until the current college year, not less than four hundred young men of limited means have found in the "Helping Halls," as they were called, the solution of their problem, and have been enabled to take a full or partial college course. Every year the "Hall" men have won distinctions, class honors, prize medals, or literary society positions. In 1883 the four honor men were "Hall" men.

Peculiar advantages are offered to young men who are preparing for college, through the facilities offered by Seney Hall, the gift of a gentleman of New York, for whom it is named.

ILLINOIS.

Of twenty-four scholastic institutions of Illinois, included in Table 49, five are designated as universities. Four of this number and five others, styled simply colleges, report professional schools or departments. All of these have preparatory departments, business courses, and normal courses, while special schools or departments of art and music are reported by the great majority.

Twenty of the number are in recognized affiliation with some one of the religious denominations. The majority of these owe their existence and whatever they possess in the way of permanent endowment to that zeal for learning which has been characteristic of the Christian Church in America.

As a rule the year's record of these colleges and universities presents no unusual feature, the information received being fully presented in the tabulated details.

The Illinois Wesleyan University, Bloomington, calls special attention to its laboratory facilities. During the past two years more than thirteen hundred dollars have been expended in adding to the efficiency of these rooms. It is intended to fit up a biological laboratory by the opening of the next term. When this is completed the opportunities for original work in the natural sciences offered by the university will, it is said, be unsurpassed by any institution in the State.

North-Western University, Evanston, comprises a preparatory school, college of liberal arts, a woman's college, departments of music, art, and elocution, three theological schools, a college of medicine, and a college of law.

It reports an endowment fund of \$1,785,255, of which \$1,485,255 are accredited to the college of liberal arts. A large part of the fund is as yet unproductive.

The Dearborn University, presided over by Prof. George W. Hough, A. M., is the astronomical department of the university. In 1887, through the liberality of the astronomical

society of Chicago, the university came into possession of a great equatorial refracting telescope, made by Alvan Clark & Sons in 1861. J. B. Hobbs, Esq., formerly president of the Chicago Board of Trade, contributed the funds for a new observatory. The best plans have been employed in the construction of the building, which will soon be ready for occupancy.

The university is encouraging young men and women to seek thorough preparation for its college course by the offer of scholarships available for graduates of Cook County high school who successfully pass a competitive examination.

Abingdon College has united with Eureka College, at Eureka. The educational work of the Society of Disciples or Christians is thus concentrated, with the promise of a more vigorous work than could have been carried on by the separate colleges.

Knox College, Galesburg.—The semi-centennial celebration of Knox College, which occurred in 1887, has had a stimulating influence upon the college. The standard of admission to the scientific course has been raised so much as to require an additional year of preparation, and French has been made optional for two years of the course.

Arrangements have been completed for the erection of an astronomical observatory in the college campus, a superior telescope has been secured, and the services of a distinguished astronomer engaged.

Military drill, introduced in 1884, has proved a most important addition to the facilities offered by the college for physical training.

Knox Seminary for young ladies is a department of Knox College. The course of study occupies four years, and offers facilities for thorough mental discipline and liberal culture. It is planned with reference to the ordinary duties of intelligent, educated women, and to the special requirements of those who desire to teach.

The college courses, classical and scientific, are also open to young ladies.

Lake Forest University, Lake Forest, comprises an undergraduate department located at Lake Forest, and professional departments located partly at Lake Forest and partly in Chicago. The undergraduate department includes four distinct schools, Lake Forest College, Ferry College for Young Ladies, Ferry Hall Seminary, and Lake Forest Academy. The professional departments comprise a philosophical faculty located at Lake Forest, and a medical faculty located for the sake of clinical and hospital practice at Chicago. The philosophical faculty has in charge the post-graduate courses intended to give preparation for the profession of teaching, for journalism, and other literary work. The medical faculty forms two distinct schools, Rush Medical College and the North-Western College of Dental Surgery.

The university faculty has recently been increased, the buildings improved, and the courses of study more fully developed and systematized.

Ferry Hall for Young Ladies has been raised to the college standard, and its accommodations and facilities greatly increased by additional buildings representing a value of sixty thousand dollars. Examinations for admission to the college departments of the university are held in the chief cities of the West.

Association of College Presidents.—The Illinois School Journal for February, 1888, states that at a meeting held in Springfield, apparently in January, an association of college presidents and professors was organized by calling Prof. J. C. Hutchison, of Monmouth College, to the chair, and appointing G. R. Cutting, of Lake Forest University, secretary. A committee appointed at Chicago the preceding season recommended a permanent organization, and presented a constitution, which was adopted. Officers for the ensuing year were chosen, and twenty-two presidents and professors of colleges joined the association, which was made a section of the State Teachers' Association.

INDIANA.

Table 49 gives the statistics of fourteen institutions of Indiana. Of these, three are designated as universities; two of the three comprise colleges of liberal arts and professional schools.

The Indiana University, Bloomington, has a large and able faculty, and maintains a vigorous work. The appliances for scientific instruction have been materially increased during the year.

In 1883 the General Assembly of Indiana passed an act providing for the permanent endowment of the university by levying a tax of one-half cent on each one hundred dollars of taxable property, to be collected annually for thirteen years. This fund, it is estimated, will amount to about three-quarters of a million dollars at the end of the thirteen years, producing an annual income equal to that now received from all other sources.

De Paux University, Greencastle, is organized on the basis of an English rather than that of a German university, consisting of an assemblage of schools, clustering around a regular "College of Liberal Arts." Under one charter there are included a college, a school of theology, a school of law, a school of didactics, a school of music, a school pre-

paratory, a military school, etc., each one of which is distinct in faculty and autonomous in management. The chancellor's position is mostly advisory, and the president is the real and active head of the whole university; and their names, therefore, stand as such at the head of each faculty. That is, the chancellor and president being chancellor and president respectively of the whole university, are chancellor and president of the several parts, *i. e.*, of the college and each of the several schools. The dean of a school is the president of that particular school, under the president of the university and its chancellor as superior officers.

The large endowment derived chiefly from the gifts and bequests of the late Hon. W. C. De Pauw has placed the university upon a sound financial basis. The productive fund, which is now estimated at four hundred and fifty thousand dollars, will be largely increased when the whole amount bequeathed by Mr. De Pauw becomes available.

The needs of the university as regards libraries, apparatus, and buildings are constantly urged upon its friends and patrons, and the determination is manifest on the part of the trustees to develop here an institution of a very high order.

The year under review has been marked by a large attendance and earnest work on the part alike of students and professors.

Wabash College, Crawfordsville, which has just completed its fifty-fifth year, shows a steadily increasing patronage.

The course of undergraduate study extends through four academic years, and leads to the degree of bachelor of arts in the classical department and to the degree of bachelor of science in the scientific department. The classical course does not differ essentially from that of the best American colleges, while the scientific course is provided for students who prefer the modern languages, especially German, and desire a more advanced knowledge of the sciences. Both departments include two classes of studies, the required and the elective, attendance upon which is obligatory.

Attention is called to the reduction of tuition recently made by the trustees. From careful calculations it appears that the expenses of a student in the collegiate department may be met from one hundred and sixty-six dollars a year.

The college possesses four beneficiary funds, available for worthy students. By an agreement between the Legislature of Indiana and the trustees of the college each county of the State received a scholarship, entitling its commissioners to appoint a student for five years on free tuition. The commissioners of twenty-three counties are still entitled to appoint students on the "county scholarships."

In order to stimulate the students of the State to strive for thorough scholarship, the board of trustees has also ordered that a free scholarship be awarded to each male graduate of good character from any high school or classical school in Indiana, who, at his graduation, shall receive a certificate that he is the best male scholar of his class. This certificate must be presented to the treasurer of the college as soon as the student enters. The holder of such scholarship is exempt from all college charges, and is admitted without examination to the Freshman class.

The endowment of *Hanover College, Hanover*, has been increased during the year by a number of gifts, the largest of which was from Rev. James A. McKee, D. D., of Thomasville, Ga. Dr. McKee has completed the endowment of the chair of "Ethics and Christian Evidences" by an additional gift of ten thousand dollars, making the professorship now twenty thousand dollars. This is the first professorship endowed by an alumnus of the college.

The *Indiana Academy of Science* is an association developed within a few past years from a small beginning to a membership of more than two hundred amateur and professional scientists. Almost every division of science is said to be well represented by a large number of investigators.

The officers for 1888-89 are: President, J. P. D. John, of De Pauw; vice-presidents, J. C. Branner, of Indiana University; S. C. Mendenhall, of Rose Polytechnic Institute, and O. P. Hay, of Butler University; secretary, Amos W. Butler, of Brookville.

On Friday, December 27, 1883, upon the adjournment of the *Indiana Academy of Science*, a body of fifteen students of natural sciences met and organized a "Western Society of Naturalists." Its purpose is to discuss methods of teaching and investigation in the line which that title indicates, and to provide measures of administration.

IOWA.

The statistics of nineteen institutions of Iowa are included in Table 49. Five of these are styled universities.

Thirteen of the entire number of universities and colleges report preparatory departments. Normal and business courses are not so prevalent as in the majority of the Western States.

The University of Iowa owes its endowment to the "Seminary Fund" derived from the sale of lands set apart for that purpose by the United States, and to annual appropriations from the State.

As yet Iowa has not followed the precedent of many Western States in providing a distinct tax for the university fund. This measure, which has proved beneficial wherever adopted, is urged upon the attention of the Legislature.

* Twenty-two per cent. of the reported income of the university is derived from tuition fees received in the various departments. In the college department the annual charge to each student is twenty-five dollars. It has been determined, however, by the board of regents that no student need be excluded from the university by reason of his inability to pay tuition. Applications for reduction of tuition, or for exemption therefrom, may be made to the president, and will be considered by the executive committee or by the board of regents.

As will be seen by reference to the detailed statistics, the university makes an excellent showing as regards library, scientific apparatus, and property valuation. It has also a large and able faculty. The admission requirements indicate the purpose of maintaining high standards in all the college courses.

Iowa College, Grinnell, has had a prosperous year with substantial increase of its permanent resources. The number of students is constantly increasing, especially in the collegiate department.

The faculty are meeting with success in their efforts to bring students into the regular courses. It is recognized that this is one of the most effective means of inspiring students to hold steadily on and graduate with their classes.

The commencement of 1887 witnessed the inauguration of the college's second president. The occasion was further notable for substantial gifts. Ex-Governor Samuel Merrill, of Des Moines, pledged twenty thousand dollars to endow a professorship yet to be designated by him.

Mr. Alonzo Steele, of Grinnell, gave twenty thousand dollars to endow the chair of mathematics and natural philosophy, to be called, in memory of his daughter, the "Myra Steele" professorship. The alumni are enthusiastically at work on a fund to endow the "Alumni Professorship," the department yet to be specified. They have already secured in cash and interest-bearing notes about four thousand dollars.

Hon. E. A. Goodnow, of Worcester, Mass., has added to his other gifts to the college the offer of five thousand dollars to be put in the hands of the trustees for a ladies' college whenever they are ready to go forward with the work. The college is to bear the name of "Mary Grinnell Mears," in honor of a graduate of the college who was the wife of Mr. Goodman's pastor. It is planned to put up this building in the summer of 1888.

Other gifts to the amount of \$3,750 are reported.

Griswold College, Davenport, under the auspices of the Protestant Episcopal Church, comprises the following departments: Wolfe Hall, Collegiate; Lee Hall, Theological; Kemper Hall, Diocesan School for Boys, and St. Katharine's Hall, Diocesan School for Girls.

Wolfe Hall offers three courses of instruction,—a four-year classical course; a three-year scientific; and a one-year commercial course. The appointments of the college are excellent; it has at all times maintained high standards, and its graduates are found in places of trust and honor.

The eighth annual session of *Drake University, Des Moines*, opened in the autumn of 1888 with a very large attendance.

The *Callinan College* has been placed under the management of the university board, and normal, musical, art, law, medical, and business schools are in operation.

The report of *Franklin College, Franklin*, shows progress in many particulars. During the year a chair of modern languages has been added, and the chair of sciences divided between botany, and geology, and chemistry, and physics.

A new building is in process of erection, which will greatly increase the facilities of the college.

Report of Committee on Uniform Admission Requirements.—A conference of superintendents and high school principals of Iowa with the faculty of the State University of Iowa, to determine uniform requirements for the admission of high school graduates to the university, reported the following course; the numbers indicating the number of terms, and the studies printed in italics; the elective courses to be taken in order to admission to the classical course:

First year: *Civil government*, 2; *algebra*, 1; *history*, 2; *composition*, 1; *Latin* 3; *English grammar*, 3.

Second year: *Algebra*, 2; *geometry*, 1; *rhetoric*, 2; *botany*, 1; *Latin*, 3; *natural philosophy*, 2; *physical geography or zoölogy*, 1.

Third year: *Geometry*, 3; *English literature*, 3; *Latin*, 3; *commercial arithmetic*, 2; *chemistry or astronomy*, 1.

KANSAS.

The University of Kansas, Lawrence, shows steady progress year by year in all the conditions of a vigorous work. The standards of admission have been raised within the last three years, and the normal department and the lower classes of the preparatory department have been dropped.

The immediate effect of these changes was a slight reduction in the aggregate of students. The enrolment for the present year, however, has reached a larger number than that for 1884-85. The students entering have better preparation and greater maturity of mind than formerly; as a consequence they are more interested in advanced work and show larger results for the instruction, whereby the university is greatly advanced in the esteem and confidence of the people.

Since 1885 the following have been added to the university buildings: The Snow Hall of natural history, for which the Legislature appropriated fifty thousand dollars at its session of 1885. A stone building to contain the steam-heating plant and the engine and other heavy appliances of the electrical engineering department; appropriation for the same, sixteen thousand dollars.

Large additions have also been made to the cabinet collections, laboratory equipments, and other apparatus.

The rapidly increasing demand for well-trained electrical engineers has led the university to provide a course of theory and practice in both light and heavy electrical engineering. It comprises, in addition to applied electricity, full courses in general physics and chemistry, such training in mathematics as is necessary to the proper understanding of the theories of electricity and magnetism; in French and German as will enable the student to read scientific works in those languages, and in mechanical drawing as is required for making drawings of machinery. Such studies in civil engineering as are deemed essential to the electrical engineer are also included in the course.

Excellent facilities for practical work in general physics, chemistry, and light electrical engineering are provided in the very completely equipped laboratories of the university.

The people of Lawrence are working toward the construction of a building for the accommodation of lady students at the university. A committee of citizens has been appointed to solicit subscriptions for this purpose, and there appears to be a fair prospect of twenty thousand dollars being raised at an early day for the object stated.

Ottawa University reports that a site for a new building has been chosen and preparation made for laying the foundation during the current year.

Washburn College, Topeka, has made material additions to its equipment for science instruction during the year. It offers courses leading to the degree of bachelor of arts and bachelor of science.

The corner-stone of the main building of *Garfield University, Wichita*, was laid in November, 1887, under a charter dated April 6, 1886. The building covers more than an acre and a half of ground; will cost when completed two hundred thousand dollars, and is expected to be completed in September, 1888. The north wing, containing twenty-one rooms, was finished and furnished in 1887; several departments were opened in September of that year, and colleges of arts, music, business, and theology have been established with about twenty-five teachers and more than three hundred students; also a normal college at Enterprise.

KENTUCKY.

Table 49 contains the statistics of thirteen colleges of Kentucky. All of these have preparatory departments: four report normal and commercial departments, and two the latter only. Several of the colleges have suffered diminution of patronage and other embarrassments during the year from the failure of the crops in the sections upon which they depend for support.

Ogden College, Bowling Green, makes provision for a two years' preparatory course and three college courses of four years each.

President Obenchain, A. M., in his return to the Office calls attention to the fact that "the free basis on which this college has been organized necessarily limits the number of students, as the funds for salaries and other expenses are derived almost entirely from the productive fund." By working six hours a day in the class-room, he says, "our present faculty can instruct about one hundred pupils, provided the classes are suitably divided. In 1886-87 we had during the year one hundred and fourteen students, which for a time taxed our capacity. Last year, 1887-88, the number was seventy-eight. The falling off was mostly from the country, and was doubtless mainly due to the disastrous drought we had in this section last summer. Our courses are well arranged, and our work is thorough as far as it goes. Appointments from this Congressional district to West Point and Annapolis have for some years been taken from the boys who have passed

through our preparatory department, and all of our graduates who have afterwards gone to higher colleges or universities have invariably taken a high stand and acquitted themselves with honor."

Georgetown College, Georgetown, reports a new gymnasium due to gifts from liberal friends.

LOUISIANA.

The Louisiana State University and Agricultural and Mechanical College, Baton Rouge, was formed by the consolidation of the two institutions whose names are retained in its designation.

The history of the State University dates back to 1806, when the first grant of land was made by the United States Government for a seminary of learning in the State. The institution was formally opened January 2, 1860.

The Agricultural and Mechanical College was established by legislative action in 1873, to carry out the provisions of United States land-grant act of 1862.

The first joint session of the two institutions was opened October 5, 1877.

By act of Congress approved July 12, 1886, the United States barracks at Baton Rouge were turned over to the university, which has thus secured excellent housing and ample grounds.

The duty of making adequate appropriations for beautifying the grounds and fitting and furnishing the building for scholastic purposes is urged upon the General Assembly of the State by the board of university supervisors.

The institution comprises a sub-freshman department, having a two years' course, a course in agriculture, and a course in mechanics and civil engineering, each leading to the degree of B. S., and a literary course leading to the degree of B. A.

The above-mentioned courses are all of four years' duration. There is also a commercial course of two years.

Tulane University, New Orleans, has just completed its fourth year. During this brief period it has achieved an enviable reputation and has contributed materially to the solution of some of the more important problems of modern education.

The university ideal carried out in its organization is that of an institution for the pursuit of all knowledge and the training of all the faculties. It comprises a high school, a college of liberal arts, the Sophie Newcomb Memorial College, opened October, 1887, a law and a medical school. The two last-named are schools of long standing and wide repute.

In the conduct of studies the line "between university work and collegiate or academic work is sharply drawn. The former is elective and of the most advanced character; the latter is embraced in a series of equivalent curricula, extending through seven years, three in the high school and four in the college, all leading to the degree of bachelor of arts, with or without distinction, according to attainment."

A manual training school has been established, with reference to which the current catalogue says: "It is considered as the workshop or laboratory of the high school for technical training; but other students of Tulane College are admitted to it on easy conditions. It is not intended to teach trades to young men, but to make them experts in the principles and handicraft of wood-working, iron-working, and machine construction. The appliances are as nearly perfect and the scheme of instruction as thorough as in any institution in the United States. The effort will be made to dignify and elevate labor without interfering with more abstract pursuits."

The university also maintains a free drawing school, with day and evening classes.

In answer to certain objections to this work as alien to the legitimate province of a university, the conception of the trust imposed by Mr. Tulane and the results of the experiment are submitted in the following statement:

"The duty imposed upon his administrators by Mr. Tulane was the higher education of the white youth of Louisiana, and they were constrained, in view of the depressed condition of education here, to take the broadest view of their responsibility. Recognizing that the prime function of the university is the higher education of its students, and that it also owes to science and the world encouragement and aid in the prosecution of original research, investigation, and discovery in some of the many branches of human knowledge, they felt that, to complete the round of its duty to humanity, the university had still the further duty to assist in elevating the general level of tone and culture in the community and State by every means in its power. The two former objects were effected directly, and the third indirectly, by the appointment of an able and energetic faculty. But an intelligent and appreciative public is an atmosphere essential to the growth and prosperity of the university itself, and, with the many discouragements to education here, it behooved its guardians to take energetic steps for the enlightenment and improvement of all who aspired to a better intellectual condition. Their good faith

in carrying out this view is evinced in our free museum, our free libraries, our free public lectures, and our hospitality to every association engaged in legitimate literary or scientific work. But their largest, most direct, and most fruitful scheme of public beneficence has been the free drawing school.

"Drawing as an art is the foundation of so many branches of industry and as a training calls into play so many faculties of man, that the education of a community in it would be a priceless gift. In no other way could Tulane University do so much for the general public as by extending to all who sought this means to further self-development gratuitous instruction in drawing. Classes were opened and hundreds eagerly availed themselves of the privilege. More than twenty-five hundred pupils have received free tuition, numbered by separate years, and more than fifteen hundred, allowing for the double counting of those who have followed the course more than one year. So far no one has been denied admission to these classes who came within the category of bread-winners, and indeed the only restriction placed upon entrance has been immaturity in age or incompatible duties."

MAINE.

The reports received from the three well-known colleges of Maine show a continuance of all the conditions of excellence that have characterized their work for many years.

The record for 1887-88 offers few particulars beyond those included in the tabulation. President Pepper, of Colby University, reports that "the curriculum has been somewhat changed, owing to two distinct causes; the first, the introduction of a new professor into the faculty; the second, the observed failure of the single elective plan to meet the expectation of the faculty or the wants of the students. As the extent of our elective studies is comparatively limited, and must necessarily remain so, it is judged safe to rely upon the preponderance of required studies to secure steadiness and unity. The electives, as heretofore, fall wholly within the Junior and Senior years, and, with some notable additions, remain as they were, but each student is allowed to choose from term to term from the courses offered. This is giving satisfaction to all."

With reference to the experiment of introducing Hebrew as a Senior elective the president says: "I call special attention to this, as the board of trustees of Newton Theological Institution last year requested this board and the board of Brown University to introduce Hebrew as an elective. It seems to me not likely that much advantage to our theological seminaries will be realized, unless the principal colleges unite in the introduction of the Hebrew into their respective curricula. I would suggest that the matter be left with the faculty for the present. They are sure to consider it carefully and to act wisely."

Professor Adams, director of the gymnasium, reports that "the past college year has witnessed the first serious attempt at Colby to provide for the students opportunities for that regular and systematic exercise which all physiologists recognize as a prime necessity in the maintenance of perfect health."

"The claim which the young ladies of the college have to a share in the opportunities for physical training afforded by the college was substantially recognized at the beginning of the fall term by the establishment for them of a class for regular exercise. This class has been continued through the greater part of the year, four half hours a week being given to it during the fall and winter terms, and three half hours during the summer term. Though a complete innovation it has seemed to meet with as much success as could fairly be expected. The hinderances to a full realization of the benefits of the gymnasium work have been greater with them than in the case of the young men.

"The only hour suitable for the class was that just before a recitation, and this fact undoubtedly contributed to lessen the attendance. Various reasons prohibited the use of the gymnasium costume, which is an important feature in all gymnasium work. About fifty per cent. of the lady students have taken the exercise regularly, and the enthusiasm for the work that has been evinced leads me to believe that were better facilities afforded very general attendance would result.

"Other means of obtaining a proper amount of exercise being largely wanting to them, the gymnasium becomes of double value, and I should expect the gymnasium exercise to exert a very marked and satisfactory influence on their general health. The experiment of conducting their classes in the gymnasium used by the men at other times has shown that it can be done with advantage."

MARYLAND.

In his report for 1887-88 Dr. D. C. Gilman, president of *Johns Hopkins University, Baltimore*, gives the following summary of the years: "In this review of the activity of the university during the year 1887-88 steady advances may be perceived. The number of students has increased; the standard of scholarship has been maintained; the publications have been as many as ever; the fidelity and enthusiasm of the princi-

pal teachers can not be too strongly commended. Our only cause for anxiety is the loss of income from the stocks which were given to the university by its founder."

He also calls attention to the following particulars relative to the number and classification of students during the twelve years since the opening of the university: "During twelve years twelve hundred and sixty-nine individuals have been enrolled as students, of whom five hundred and seventy have come from Maryland (including four hundred and forty-eight from Baltimore) and six hundred and ninety-nine from fifty other States and countries. Of this number seven hundred and thirty-three persons pursued courses as graduate students and five hundred and thirty-six as collegiate students.

"Since degrees were first conferred in 1878 one hundred and seventy-seven persons have attained the baccalaureate degree, and one hundred and thirty-one have been advanced to the degree of doctor of philosophy."

The following extracts from his report relate to subjects of widest interest as regards the highest order of scholastic work:

Work of Investigation and Publication of Results.—"In the encouragement of advanced studies and the publication of results this foundation has aimed to do its part. By precept and example hundreds of young men have been trained in the methods of exact science and the habits of accurate investigators. Not a few of these students have been called into the scientific service of the Government; many are engaged in laboratories, scientific and technical; more are employed as teachers in training up other young men. We can point to no result of our efforts which is so gratifying, and which so thoroughly repays the outlays of this foundation, as the corps of graduates who have gone out from among us to every part of the country, prepared to contribute to the progress of knowledge, and who are now rendering good service to science, literature and education. By encouraging the publication of journals and monographs this foundation has endeavored to supply another of the deficiencies referred to above. Five periodicals, devoted to mathematics, chemistry, biology, philology, and history, have been aided by the university chest, and three others, devoted to archaeology, psychology, and modern languages, have been initiated on the personal responsibility of certain members of our academic staff."

Provision for the study of astronomy.—"An observatory for instruction is now provided. Beside the telescope mentioned in the last report, the university has purchased a meridian circle (made by Messrs. Fauth & Co., of Washington), with collimators, mercury basin, and other appliances. * * * To receive this instrument a special structure has been built adjacent to the physical laboratory. A class in practical and theoretical astronomy has been organized under the guidance of Prof. Simon Newcomb, for many years connected with the Naval Observatory in Washington, and now Superintendent of the U. S. Nautical Almanac. During the coming year he will be assisted by Mr. Charles A. Borst, lately one of the astronomical observers of Hamilton College, who has received among us the appointment of a Fellow."

"From these statements it is apparent that we are now provided with the most important of the astronomical apparatus suggested many years ago by Professor Newcomb in one of his public lectures as desirable for the practical instruction of astronomers. We have also the qualified teachers, and a company of students has begun the prescribed course. The further development of this department of study will be watched with great interest. Its distinctive character is its adaptation to the needs of young men already proficient in mathematics who need to be trained in the methods of astronomical inquiry, and who want easy and constant access to suitable instruments, as they have in the laboratories of chemistry and physics.

"One leading idea of the work is to associate with the technical study of the subject a greater breadth of culture than can readily be gained by the student whose attention is wholly occupied by practical work in the observatory or the field. It is therefore intended that all students taking the doctor's degree in astronomy as their principal subject shall have an understanding of the historic development of the science since its beginning, of the additions made to it by its leading cultivators, of the mathematical theories of the celestial motions, and of the practical use of the most important astronomical instruments."

The Laboratories.—The new physical laboratory, whose completion was noted in the Commissioner's Report for 1886-87, gives greatly increased facilities for instruction and also greater scope and efficiency to the investigations carried on. "Arrangements have been matured for beginning, in the autumn of 1888, the testing of electrical instruments and standards for other laboratories, scientific and industrial. This work, under the supervision of the chief instructors, will be intrusted to Dr. Liebig, a recent graduate in physics, who has shown himself well qualified for the responsibility. Correspondence between Dr. Duncan, associate in electricity, on one part, and the leading electric manufacturers and the professors of physics in different parts of the country on the other, has indicated the need of such a bureau as is now established. Its actual utility will

soon be demonstrated." Work in the chemical laboratory has been prosecuted with increased enthusiasm. During the past year every available place in the laboratory has been occupied, and the director is obliged to call attention to the necessity for an increase of accommodations if this state of things continues.

"Since the foundation of this university the biological sciences have received special encouragement, partly because of the rapid advances that they have been making and partly because of their relation to the progress of modern medicine. Prolonged courses of training are arranged for those who propose to devote their lives to investigation or to teaching in these branches, as well as for those who intend at a later period to study for the profession of physicians and surgeons. As in physics and chemistry, abundant facilities for laboratory work are called for; instruments, materials, and assistants have been and must be liberally provided."

"The unusual opportunities which have here been provided for students to become acquainted with the most recent methods of pathological investigation are but little known, partly because of their novelty and partly because pathology has been usually regarded as a branch of a distinctly professional education. Looking forward to the time when a medical school will be organized—in close relations to the Johns Hopkins Hospital on the one hand and to the philosophical faculty of the university on the other—the trustees in 1883 determined to supplement the physiological work already directed by Dr. Martin with a new department of pathology, in which the most recent and approved methods of research should be introduced. * * * All the apparatus required for such investigations has been provided by the trustees. Cultures of a large number of pathogenic micro-organisms have been collected, and likewise a great deal of material illustrative of human and comparative pathology. The laboratory is open and teachers are present during the entire day."

The president expresses regret for the unexpected interruption in the department of psycho-physics consequent upon the acceptance by Prof. Stanley G. Hall of the presidency of Clark University.

The report presents full and interesting information relative to the courses of instruction in language and literature. The progress which Assyrian studies have made in the universities and theological schools within the past few years gives peculiar interest to the part of President Gilman's report relating to the work of Dr. Haupt, one of the leaders of this movement.

In addition to his work as instructor and investigator, Dr. Haupt "has begun the publication of a journal entitled *Contributions to Assyriology and Semitic Comparative Philology*. * * * He has also in press the second part of his *Babylonian Nimrod* epic, containing the cuneiform text of the eleventh and twelfth tablets, as well as some new fragments of the poem found since 1882. The cuneiform account of the Flood (first brought to light by George Smith in 1872) will be considerably advanced and corrected by this new edition. The fragments were all copied by Dr. Haupt from the originals in the British Museum, in 1882, and recollated during the past summer.

"Arrangements have also been made for publishing the now scattered writings of Dr. Edward Hincks, of Dublin, the early and successful interpreter of cuneiform inscriptions.

"An announcement still more important has been made to the American Oriental Society by Professor Haupt. With the co-operation of some of his advanced students, he has begun the preparation of an Assyrian glossary. The work is going on at the present time, but of course the period requisite for its completion is not certain. * * * Baltimore affords special advantages for the pursuit of the studies owing to its proximity to Washington. The U. S. National Museum is making an effort to develop its Oriental section, and before the end of the year there will be placed on exhibition a study collection of Assyrian and Egyptian monuments which will furnish an excellent opportunity to students desiring to draw directly from the original sources. It may be stated in this connection that Professor Haupt and Dr. Adler were appointed in February last honorary curator and honorary assistant curator of the Oriental antiquities in the U. S. National Museum."

St. John's College, Annapolis, is an outgrowth of King William's School, founded in 1696 by an act of the General Assembly, and opened for instruction in 1701. In 1784 the school was merged into the newly chartered St. John's College, which began practical operations in 1789. The college has therefore completed a century of work, while through the original school its history is traced back to the colonial period. Among the distinguished alumni of the college appear the names of William Pinkney and Francis Scott Key, the author of our national ode, "The Star Spangled Banner."

The college comprises a preparatory department, having a three years' course. The collegiate courses are four in number, each of four years' duration. They lead to the degrees of B. A., B. S., B. L., and M. E.

In his return to this Office for the current year, President Fell says: "This college is

entirely unendowed, and depends for its income upon appropriations by the State and the tuition fees. * * * In spite of this and in spite of the withdrawal of the appropriation by the State in former years, the college prospers. The number of students steadily increases; the work done by them is highly satisfactory, and is recognized by the Johns Hopkins University as on a par with the work done by the students of that institution."

MASSACHUSETTS.

In his report for 1887-88, Dr. Charles W. Eliot, president of *Harvard University*, states that "in 1883 for the first time the examinations for admission to the college were conducted exclusively on the new plan announced in 1886."

The subjects presented by the candidates show that the secondary schools, and the private tutors who prepare boys for college, "have already responded in fair measure to the new suggestions, offers, and requirements of the faculty," and that the "new requirements have already stimulated the teaching of French and German in secondary schools, and have promoted the introduction of laboratory methods of studying physics and chemistry."

Dr. Eliot observes further that "under the former scheme of admission examinations, the commonest method of entering was by presenting all the required elementary subjects, but not both French and German, and among the advanced subjects Latin and Greek with composition. On the average of the years 1883 to 1886, inclusive, this set of subjects was offered by two hundred and twenty-one candidates out of three hundred and fifteen, but in 1888 by only one hundred and forty-four candidates out of three hundred and fifteen; yet this was still by far the commonest combination of subjects, the next group of candidates who offered a common set of subjects numbering but thirty-one. In all, seventy-six different combinations of subjects were presented; but this diversity caused not the slightest embarrassment in the conduct of the examination. This liberty of choice among the subjects of examination has the effect to increase very sensibly the number of candidates who offer more subjects than are required. One-quarter of all the candidates in 1888 offered more subjects than were necessary. This fact shows two things: (1) that some schools already give instruction in more than the minimum number of subjects; and (2) that many boys can do more work before coming to college than the admission examination calls for."

"In the gradual process of converting Harvard College into a university of liberal arts and sciences" the president reports "that the average gain was made in 1887-88."

"In respect to the volume of instruction, the gain of 1887-88 was about five per cent., that is, from four hundred and eighty-five hours a week to five hundred and ten hours, without counting repetitions, and this gain coincides with the average annual increase of the last five, or of the last ten years.

"In respect to freedom in choice of studies, the Freshmen gained access to the departments of Italian, Spanish, and music, from which they had previously been excluded."

"In respect to co-ordination of courses, an important improvement was made by recasting the whole set of courses in physics, so as to secure a better sequence of subjects and a more complete covering of the ground; the opportunity for special advanced study and research was offered for the first time in German, and more explicitly than before in romance philology; and the corresponding opportunities in history, physics, and chemistry were enlarged.

"Lastly, the *morale* of the college was favorably affected by several causes. In the first place, the assured success of the voluntary method in the religious services of the university, concerning which some anxiety was felt during the first year of trial (1886-87), was a solid satisfaction to every member of the university, whether teacher or student."

"Secondly, a considerable number of instructors used effectively during 1887-88 the new regulations of 1886, which provide that every student shall satisfy his instructor in each of his courses of study that he is performing the work of the course in a systematic manner, and that any instructor may, with the approval of the dean, exclude from his course at any time a student who is neglecting the work of the course. These regulations emphasize the fact that membership in any instructor's class is a privilege granted by the college—a privilege to be kept only by regular attendance and systematic work to the satisfaction of the instructor."

"This direct personal relation between the instructors and students, free from the intervention of any officials charged in a formal way with the maintenance of college discipline in general, is in the highest degree wholesome and satisfactory. The regulations of 1886, together with the careful maintenance and watchful use of the record of each student's attendance, which is kept in the dean's office, promise to solve all the remaining difficulties of the transition from the former mechanical system of enforced attendance, with all its pernicious apparatus of excuses, certificates, and graduated penalties, to a system of rational liberty with direct personal responsibility for

results. In all its discipline, the college faculty tends to abandon the principles of government implied in the words, offences and punishments, and to act, even in cases of gross neglect or vice, on the principle contained in the last clause of the statute concerning students not candidates for a degree: The several faculties have the right to deprive any such student of his privileges, if he abuse or fail to use them. A third cause of improved relations between faculty and students was the exhaustive report on athletics which was presented to the college faculty in June last by Profs. J. W. White, Chaplin, and Hart, an outcome of a discussion which took place in the board of overseers during the spring. This report, with the accompanying statistics, disposed of some of the objections to athletic sports and intercollegiate contests, demonstrated their general utility, and set in a clear light the improvement of the average physique of the students which the gymnasium and the various sports had together brought about. Although the report contained many criticisms upon the present managements of athletic sports, its general effect was highly encouraging both to the faculty and to the undergraduates as to the moral and physical effects of athletics at Cambridge taken as a whole. It immediately brought about a better understanding between the faculty on a subject of great interest, concerning which there had been much divergence of opinion. Some of the recommendations of the report have been already adopted, and others are likely to be. There are still many excesses and evils connected with athletic sports as intensified by intercollegiate competition; but the faculty take comfort in the general physical improvement which they witness in the average student; and they hold that dyspepsia is less tolerable than a stiffened knee or thumb, and that effeminacy and luxury are even worse evils than brutality."

"The college, including the graduate department, is now paying out more than fifty thousand dollars a year to students who need aid to compass their education."

"In 1887-88 the faculty instructed the dean to inform holders of scholarships that they are expected to present themselves twice a year before the director of the gymnasium to be examined as to their physical condition, and receive suggestions as to the care of their health."

The graduate department had a larger attendance than in any previous year. "Nevertheless," says the president, "the resort to this department from other colleges is still small in proportion to the volume of advanced instruction offered and to the unequalled facilities for research in all directions which the university libraries, laboratories, and collections afford. The secretary of the academic council again urges that more scholarships are needed for graduate students. The eager demand for the six Morgan Fellowships and the excellent quality of the incumbents from year to year are strong arguments in favor of more such endowments."

The professional schools of the university have been unusually prosperous during the year. "The Divinity School is the only professional school of the university which receives no students as candidates for its degree who are not already bachelors of arts. Considering the small number of students in the school, it is recruited from a remarkable number and variety of colleges. Thus, in 1887-88, seventeen students came from three theological seminaries and twelve colleges, and in 1888-89 twenty-six students came from three seminaries and fourteen colleges."

"Since the statement was made in the report for 1877-78 concerning the unsectarian policy of the school and its pecuniary needs, its endowment, apart from its share in the income of the Bussey Trust, has been more than doubled, a new building has been provided for it, its library has been much increased, and, best of all, important additions have been made to the permanent teaching staff."

"The Law School had a year of great prosperity in 1887-88. The number of students increased 20 per cent., the Story Professorship was filled again, after having been vacant four years, and the Harvard Law School Association gave the school one thousand dollars with which to increase the amount of instruction in constitutional law during the year 1888-89."

"The year saw some important changes wrought in the Medical School. The whole course of study was revised, two hours a week of elective studies were introduced into the third year, and all the studies of the fourth year were made elective."

The medical faculty was increased in size from twenty-one to twenty-six members. One assistant professor resigned, one was newly elected, and one was promoted to be professor. Three professors and one instructor without limit of time were chosen, and the demonstrator of anatomy was appointed a member of the faculty for five years. The number of annual appointments given in the catalogue was also increased from thirty-eight to forty-five. At present, therefore, no fewer than seventy-one members of the medical profession in Boston and the vicinity are officially connected with the school of medicine."

"The Dental School was never more prosperous than in 1887-88. The admission examination instituted in 1885 at first caused the number of students admitted to de-

cline; this diminution proved to be only temporary, but the good effects of the examination abide. In 1887-88 the school had three dental professors, three instructors in dental subjects appointed for more than one year, five instructors in operative dentistry who superintended the work of students in the infirmary, and two demonstrators."

Among the gifts received by the university during the year the following are specially noted by the president:

"In November, 1887, the corporation were informed by the trustees under the will of Walter Hastings that they were ready to erect at Cambridge, according to the terms of the will, upon land to be given to the university, a college hall for students' chambers, to cost not less than two hundred thousand dollars and not more than two hundred and fifty thousand dollars.

"By the will of the late Ellen Gurney, widow of Ephraim Whitman Gurney, the university received a bequest of seventy-five thousand dollars and the residue of her estate, with directions 'to apply the net income for the support in Harvard College of higher instruction in history, political science, and literature (these subjects being taken in a comprehensive sense) in such manner as may from time to time seem most expedient to the president and fellows.' The amount realized by the university from this bequest is \$169,925.38.

"The university received during the year two wholly unrestricted gifts; the first a bequest of twenty-two thousand dollars from John Cowdin, of Boston, and the second a bequest of thirty thousand dollars from William Perkins, of Boston." (Mr. Perkins's gift was in memory of his three sons, all graduated at Harvard College.) "The oldest son (A. B. 1857) was killed at Fort Wagner, S. C.; the second (A. B. 1860), who served three years during the Civil War and was wounded at Chancellorsville, died at Boston in 1879, and the third (A. B. 1864) died in 1873.

"Mr. Henry Reginald Astor Carey, of New York, who was a special student in the college in 1886-87, gave the president and fellows twenty-five thousand dollars on November 14, 1887, 'to be used in building five courts for the use of the university, especially for the base-ball nine, either as attached to the gymnasium or as a separate building, as the corporation may decide.' The construction of the building has been delayed by difficulties in deciding on the best mode of carrying out Mr. Carey's generous intentions.

"Members of the class of 1856 gave to the president and fellows six thousand dollars as a permanent fund, the income of which 'is to be used for the publication from time to time, in a serial form, of contributions to classical learning by members of the university or graduates of the same, and such other contributions to classical learning as may be deemed advantageous to the university to publish.' This is the second publication fund which the university has received, the first being the John Elliot Thayer fund of fifteen thousand dollars for publication in the department of political economy."

The spirit of *Amherst College, Amherst*, is eminently progressive, and at the same time judiciously conservative. It was a leader in the movement for systematic physical culture controlled by competent directors. As early as 1831 Dr. Hitchcock issued a report of twenty years' experience in this department, which has given a great impulse to the work in other colleges.

In 1880 Amherst College tried the experiment of abolishing the old marking system. An assignment of rank in the award of diplomas was continued, but the old scale, with its first, second, and third classes, disappeared.

A new system of government was also introduced. Expulsion, suspension, and similar disciplinary expedients were abandoned. The matriculate became a party to a contract. He signed the college laws and engaged to keep them. In the case of his failing to keep his contract his connection with the college virtually ended. This experiment has been carefully watched, and its success has had the effect of modifying the modes of discipline in other colleges.

The following particulars concerning the present organization and conduct of Amherst are derived from the catalogue for 1887-88:

"The course of undergraduate study extends through four academic years. It embraces philosophy, history and art, language and literature, and science. Each study is pursued comprehensively, and at the same time with the minuteness requisite for the broadest and most accurate training. It is the aim of the college not so much to make specialists in any given department as to prepare the student for the best special work in his subsequent life.

"For the first year and the first term of the second year the same studies are pursued by all the students. At the beginning of the second term of the Sophomore year certain studies become elective, and these are afterward increased in number, so that during the Junior and Senior years the student, under such regulations as the faculty find it wise to prescribe, can choose such studies as are best adapted to his own needs from

nearly all the departments taught in the college. Excellent results have appeared from this method. The special wants of the student are thus met, his zest and progress in his work are increased, and his association with his teachers becomes thus more close and intimate.

* * * "The college adheres to its old requirement of Greek as a condition of entrance, and as one of the principal studies of the Freshman and Sophomore years. It insists on the mastery of this language as an invaluable discipline of the mind and an indispensable foundation for a scholarly knowledge of the languages and literatures, not only of the ancient, but of the modern European world.

"During both the Freshman year and the first term of the Sophomore year Greek is taken by every student excepting those pursuing the scientific or a special course, while it is open as an elective study during the most of the Junior and Senior years. * * *

"The work in the department of biology is all elective. It begins with the first term of the Junior year, and may be continued for the remainder of the collegiate course.

* * * "While one special aim of the department is to furnish the student of medicine with a broad foundation for his future studies, its general aim is to lead every student to a careful examination of the laws which govern the structure, actions, and occurrence of all living forms."

The departments of collegiate instruction are grouped in six general sections:

1. The Section of Philosophy.
2. The Section of Ancient Languages.
3. The Section of English.
4. The Section of Modern Languages.
5. The Section of Mathematics.
6. The Section of Natural Science.

In each of these sections the grade of the scholarship of each student is recorded on the scale of units from 1 to 5. Every student who has completed his work in each section may be admitted to the degree of bachelor of arts, or bachelor of science, and receive a diploma in testimony of the same. If his average scholarship be represented by the number 2, his diploma is given *rite*; if by 3, *cum laude*; if by 4, *magna cum laude*; and if by 5, *summa cum laude*. No student is entitled to a diploma whose work in any section is incomplete. Such student may, however, receive a certificate of his actual attainments in such partial course.

The department of hygiene and physical education is under the charge of two physicians, who keep accurately acquainted with the health of all the students. Each student, soon after he enters the college, and twice thereafter during his collegiate course, is minutely examined in reference to his strength and physical condition, and advised as to the particular course he should take for the maintenance and increase of his health and strength. A manual of average measurements, together with a record of his own measurements, is given him, and he is also directed to the most advantageous use of the ample appliances with which the Pratt Gymnasium is provided.

Beside the exercise which every student may take by himself the members of each class regularly exercise together in the gymnasium every week-day, excepting Wednesday and Saturday. Unless excused for physical disability, the attendance of every student is required at the gymnasium for the performance of the exercises in light gymnastics.

The results of the system of prescribed gymnastic training pursued in the college have been eminently satisfactory. While physiologists affirm that, as a general rule, the health of a young man from fifteen to twenty-five years of age is apt to decline, the reverse rule is found to prevail with students here. From statistics systematically kept for more than twenty years, it appears that the health of an Amherst College student is likely to grow better each year of his collegiate course. The average health of the Sophomore class is better than that of the Freshman, and of the Junior better than that of the Sophomore, and of the Senior class best of all.

Dr. Hitchcock has lately issued an Anthropometric Manual, a copy of which he gives to each student of the college, who is enabled thereby to compare his physical development with that of the average Amherst student for the last twenty-five years, and to determine the kind of exercise most favorable to his health and strength. In a statement dated November, 1887, President Seelye gives the following summary of the general progress of the college:

"Our numbers vary from year to year, but with a general tendency to increase, and with a general enlargement also of the area from which they are drawn. It is an interesting fact that about one-seventh of our annual admissions for the last few years have come from other colleges, and that these, as a rule, by the high stand they have taken here, have shown themselves students seeking for the best. Our average annual attendance for the last twelve years has been three hundred and thirty-nine,

while for the twelve years next preceding this period it was two hundred and sixty-seven. We only exceeded in numbers among the New England colleges by Harvard and Yale.

"I do not think that this is necessarily a sign of progress, or certainly a matter for congratulation. Numbers are very easily gained by any college which sets out to secure them. Where the standard of admission and instruction is kept high and no efforts are made directly to induce students to come, increasing numbers undoubtedly indicate an increasing growth of the college in the public estimate; and this is certainly to be prized. But if the classes should grow too large to permit each teacher to establish living relations by close contact with each of his pupils, this would be an evil altogether to be deplored; for education is wholly a personal work. It is not gained by books nor by instruction alone, nor by anything in place of living inspiration of the living teacher. Recognizing this fact, we have of late been enlarging our teaching force more rapidly even than our number of students has increased. Our faculty is larger by one-half now than it was twelve years ago.

"We are steadily enlarging our work in the line of political and social science, and desire the means to give it a still greater increase. The endowment by Mr. Henry Winkley, of Philadelphia, of the Winkley Professorship of History and Political Science was a great boon which has enabled the college to do more than ever before in this important department. The present year we shall add to our course in economic and social science a course also in international law, for which Dr. Tuttle has been making careful preparation in Germany and here. By the aid of friends of the college in New York, Dr. Frederic A. Bancroft has been engaged for the current year to give a special course, open as an elective to the Senior class, upon recent American history.

"The college is still keeping abreast of the times, mindful also, as it has ever been, of the principles which abide through all time. We are not beyond improvement, and are alive to any suggestions from any quarter respecting any progress; but we are not seeking for growth by severing ourselves from the living source in which the college through all its history has found its nourishment and strength. Those of you who are far from us, and not familiar with our present inner condition, will be cheered to know that the younger professors, who are to be our coming representatives, are as heartily imbued with the historic spirit of the college as the older ones. Our gratitude for the past is mingled, therefore, with joyous confidence in the future."

In his return to this Office, President Seelye writes as follows respecting the matter of discipline: "The most marked feature of the year has been the good order and decorum prevailing in the college. Under the system of college administration in vogue at Amherst, a body of students called the college senate, whose president is the president of the college, are associated with the faculty in the government of the college. Questions of college order and decorum, formerly adjudged by the faculty, are now referred to the senate, whose judgments, if approved by the president, are binding in the college. This experiment in college self-government is increasingly satisfactory. A higher self-respect and a more manly self-restraint have been among its most marked results."

The catalogue for 1887-88, of *Boston College, Boston*, calls attention to the fact that to the original classical course there was added September, 1872, at the special instance of the most reverend archbishop, a department in which the study of the ancient languages is superseded by exclusive application to English, the modern languages, and the sciences. This course is intended to offer the advantages of a thorough English education to that class of students who, not intending to follow the professions, stand in no special need of classical training; but for whom it is of importance that they be well grounded in their faith and spend a few years at least under healthy religious influence.

MICHIGAN.

The number of students at the *University of Michigan, Ann Arbor*, for the current year, according to the return made to this Office, was sixteen hundred and seventy-seven. Of this number a little less than one-half were residents of the State. Every State and Territory of the Union was represented in the attendance, three of the provinces of Canada, five European and two South American States, together with Japan and the Sandwich Islands.

President Angell, in his report for the current year, notes that the attendance exceeds that of 1885-86 by two hundred and seventy-six, and that of 1884-85 by three hundred and eighty-two. The largest gain for each of the last two years has been in the literary department, though there was an increase in every department except in that of medicine and surgery, where there was a loss of eight.

The equipment for science instruction has been materially increased by the new building for the physical and hygienic laboratories. With reference to the latter President Angell says, "it is, I think, the first established by any of our universities." The new

engineering laboratory is also nearly complete. These increased facilities for teaching science and its practical applications have been accompanied by a corresponding increase in the demand for such instruction.

Although there has been a relative and absolute increase of the number of students in the English, engineering, and scientific courses in the last few years, the classical course still attracts a much larger number than any other.

The full distribution of the undergraduate students is shown in the following comparative table:

	Percentage of Men.	Percentage of Women.
The A. B. course.....	30.7	32.3
The Ph. B. course.....	16.3	31.4
The B. S. course.....	13	9.3
The B. L. course.....	15	27
The Engineering courses.....	25	None.
	100	100

Prof. William H. Payne, A. M., whose distinguished service as professor of the science and art of teaching has attracted universal attention, has resigned to become chancellor of the University of Nashville, Tenn. His successor is B. H. Hinsdale, Ph. D., who comes into the work with the advantage of large experience and established reputation.

Albion College, Albion, reports an endowment of about \$315,000, of which \$115,000 are not yet available. It has, besides the college building, an observatory, and is in general well supplied with appliances for science instruction.

In his return to this Office for the current year President Scott, of *Hope College, Holland*, calls attention to the fact that the regular college course includes the studies which in many colleges constitute a distinct scientific course.

"We have decided," he says, "that the old-fashioned classical course, somewhat modified, is the best even for the scientifics, and this is the only one we publish" (A. B.).

Kalamazoo College, Kalamazoo, reports an increase of five thousand dollars in its annual income. This addition to its resources has been employed in enlarging the faculty and increasing the scientific apparatus.

The additions to the library during the past year have been numerous and valuable. The library of Prof. Edward Olney, containing nearly one thousand volumes, has become the property of the college. The shelves on which these volumes stood in Professor Olney's study at Ann Arbor have been transferred to the library room, and the collection thus retains its integrity, and is known as the Olney Library.

In addition to the large number of mathematical works in this collection, there are many volumes pertaining to the natural sciences, to history and general literature, and to the interpretation and illustration of the sacred Scriptures. There are also valuable encyclopædias, including the American reprint of the ninth edition of the *Encyclopædia Britannica*, and other books of reference not previously contained in the college library. The practical value of the collection is indicated by the fact that a large percentage of all books drawn by students during the year has been taken from the Olney shelves.

The new ladies' hall, erected by the Ladies' Hall Association, greatly increases the comfort of the young women who attend the college.

The facilities of *Olivet College, Olivet*, have been materially increased by a new and commodious building, erected at a cost of twenty-five thousand dollars. It bears the name of Roland Mather, of Hartford, Conn., who was its chief donor. It is devoted to scientific purposes. Besides two large recitation rooms, it contains the laboratories and lecture rooms for chemistry, botany, geology, biology, and zoölogy. It contains also the college museum and the Signal Service station.

MINNESOTA.

Dr. Cyrus Northrup, president of the *University of Minnesota, Minneapolis*, reports that the current year has been one of notable progress and development. Not only has the work of instruction been carried forward satisfactorily in all the departments which existed at the opening of this period, but the work in some of these departments has been enlarged, new departments have been organized, and the institution in its scope of instruction has been made in reality, what it has heretofore been in theory only, a university.

The whole number of persons graduated up to date has been three hundred and twenty-one. Of these, five have received degrees both in science and engineering, one in arts and in science, and six bachelors have received a master's degree after passing the required examinations. The graduates include eighty-five women, viz: bachelors of arts, thirteen; of science, twenty-one; of literature, fifty-one; of medicine, one; one of the number received a degree both in arts and in literature.

President Northrup calls attention to the gradual decrease in the preparatory department, while at the same time the number of Freshmen steadily increases from year to year. "The inference is inevitable," says President Northrup, "that the necessity for maintaining the preparatory department is constantly diminishing," and he expresses the belief that the time has come when the board of regents may safely determine upon a date for its discontinuance.

In respect to buildings, the president says: "The most pressing need of the university will be met whenever the new science hall and museum shall be finished. This building was begun in 1887. It is built of stone and has a front of 245 feet. It will furnish lecture rooms and laboratories for the work in geology, mineralogy, botany, zoölogy, and physiology. It will also furnish accommodations for the officers of the geological survey; and one wing, containing four thousand square feet on each floor, will be devoted to the museum. Provision is also made in this building for work in metallurgy and mining whenever the regents shall see fit to establish a school of mines. This building is now enclosed, but will hardly be ready for use the present year. Meanwhile the pressure for rooms large enough to accommodate our increasing classes is great, and shows conclusively that the erection of science hall was not begun a moment too soon. But even when this building shall have been finished there will remain the need of a larger chemical and physical laboratory, of a library building, of a medical college building, of a law college building, and of an observatory. The future prosperity of the university will be very much affected by the promptness or delay attending the erection of these buildings.

In *St. John's University, Collegeville*, "the curriculum pursued has been extended to meet modern demands. The courses of studies established are the ecclesiastical, the classical, medical, commercial, and scientific, besides a preparatory course for beginners."

The current catalogue of *Hamline University, Hamline*, presents an historical summary from which the following particulars are derived:

Hamline University, chartered April 3, 1854, is probably the oldest denominational institution in the State. The years of the greatest prosperity were from 1864 to 1869, when the annual enrolment reached three hundred.

In its most prosperous days, however, the institution did not have adequate financial support, and in the spring of 1869 the embarrassment became so great as to necessitate suspension. The board of trustees fully intended to reopen in two years, but a change of location having been decided upon, and unforeseen difficulties arising, eleven years passed by before they were able to carry out their intention. The new edifice was dedicated to Christian education July 20, 1880. On the 7th of February, 1883, this building was destroyed by fire. The work of rebuilding was begun at once, and on the 30th day of January, 1884, the new University Hall, a much more beautiful and commodious structure than its predecessor, was dedicated.

The Hall of Science, dedicated January 5, 1888, is a large building, well planned and equipped.

Macalaster College, Macalaster, reports a substantial library, to which valuable additions will soon be made.

The new observatory of the department of mathematics and astronomy connected with *Carleton College, Northfield*, was occupied during the year.

"The scientific department, always a prominent one in the college, is now more complete in its organization and appointment than ever before. Williams Hall, erected especially for its use, contains a large laboratory, with all necessary modern appliances for chemical experiments and analysis."

The sum of bequests received this year as reported on the return to this Office amounted to \$150,738. These donations were given by twenty-two persons, in amounts ranging from one to thirty thousand dollars.

MISSISSIPPI.

The University of Mississippi, Oxford, comprises two general departments, viz. a department of science, literature, and arts, and a department of professional education. The former includes three undergraduate courses of study leading respectively to the degrees of B. A., B. S., and B. Ph., and two post-graduate courses leading to the M. A. degree.

The only professional school established so far is that of law.

Since 1882 women have been admitted to the university upon the same conditions as men. The university is especially strong in the department of modern languages.

Clinton College, Clinton, reports temporary embarrassment from the prevalence of yellow fever in the vicinity. The fall term opened with only seventy-five students instead of one hundred and fifty, as had been anticipated; the number increased as the year advanced.

MISSOURI.

Central College, Fayette, has secured a telescope made by Alvin Clark & Son.

"Through the liberality of Col. Lon. V. Stephens, of Boonville, the college in 1886 acquired possession of a very desirable property, with a substantial brick building, conveniently situated and easily accessible from all parts of the grounds. This building, by a fund further provided by Colonel Stephens, was fitted up for the use of the scientific department of the college, and was occupied during the past year.

Substantial additions to the library have been made since the beginning of the present year.

Westminster College, Fulton.—The permanent endowment of this college has been increased by bequests to the amount of \$8,650.

On commencement day it was announced that citizens of Fulton and Callaway County had given ten thousand dollars for repairs and additional buildings. It is expected that the new building will be completed before the close of the year.

A chair of English biblical study is to be endowed.

A new gymnasium has been fitted up at some expense.

Washington University, St. Louis.—The current catalogue of Washington University gives a brief historical summary of the institution, from which the following particulars are derived:

Washington University, founded in the city of St. Louis, under an act of incorporation by the State of Missouri approved February 22, 1853, is intended to embrace the whole range of university studies, except theology, and to afford opportunity of complete preparation for every sphere of practical and scientific life.

By the eighth article of the Constitution "no instruction, either sectarian in religion or partisan in politics, shall be allowed in any department of the university, and no sectarian or partisan test shall be used in the election of professors, teachers, or other officers of the university for any purpose whatsoever. This article shall be understood as the fundamental condition on which all endowments of whatsoever kind are received." The Constitution also declares the articles now quoted "not subject to alteration at any time;" but to guard against all encroachments in this important particular, the directors have obtained from the General Assembly an amendment to the charter, by which said article is incorporated in the same, and thereby placed beyond the power of any future board of directors.

In March, 1871, the university received from the Hon. Hudson E. Bridge a gift of one hundred thousand dollars for the endowment of the chancellorship and for a library fund, fifteen thousand dollars toward the erection of a building for the polytechnic school, and fifteen thousand dollars for providing it with furniture and apparatus. In recognition of this liberality the board of directors voted that the office of chancellor should receive the title of "The Bridge Chancellorship."

The courses of study in the college are two in number, and lead, respectively, at the satisfactory completion of four years' work to the following degrees, viz: (1) bachelor of arts; (2) bachelor of philosophy.

The courses of study in the polytechnic school are four in number, viz:

- (1) A course in civil engineering.
- (2) A course in dynamic engineering.
- (3) A course in chemistry.
- (4) A course in mining and metallurgy.

The splendid equipment of the polytechnic school as regards instructors and material appliances and the standards and general conduct of studies have gained for it the highest distinction both in our own and in foreign countries.

Beside the college of arts and the polytechnic school the university includes the Henry Shaw School of Botany, established June 8, 1885, the St. Louis School of Fine Arts, and a law school dating from 1866.

St. Louis University, St. Louis.—The catalogue calls attention to the new building begun in May, 1886, and now nearly completed. It is a noble structure, and will prove an important factor in the development of the university.

NEBRASKA.

The report of the *Nebraska Central College of the Nebraska Wesleyan University, Central City*, gives the following account of recent changes in the work: "In 1886, by the action of the conferences of the Methodist Episcopal Church of Nebraska, a commission was

appointed for the purpose of unifying the educational work. As the result of earnest consideration, it was decided to unite the entire Methodism of the State on one central university, and make the existing colleges departments of the same. A friendly contest for the university was entered into by Omaha, Lincoln, York, Central City, and Bartley. It was decided in favor of Lincoln, which action was made unanimous.

"This plan meets the approval of the best men in the church, including a majority of the bishops.

"Thus Nebraska Central College takes its place as a part of a great system of education in this State, with a purpose to be second to none in the character of the work done.

"The board of university trustees have established the normal department of the Nebraska Wesleyan University in Nebraska Central College. The normal course will therefore be omitted in the university prospectus and made a specialty at Central City, making this department of Nebraska Central College the *State Normal School of the Methodist Episcopal Church in Nebraska*.

"The trustees have determined to secure donations to the amount of fifty thousand dollars for the purpose of paying off all debt, making needed improvements, and laying the foundation for a permanent endowment. Upward of thirteen thousand dollars of this amount have already been subscribed."

NEW HAMPSHIRE.

The report of *Dartmouth College, Hanover*, shows a continuance of all the conditions that have given it prestige in the past. During the year the trustees have had under consideration a proposition from a lumber company to lease to said company a large tract of land in the northern part of the State which belongs to the college, and for which the company has offered for the lumber only one hundred and fifty thousand dollars. This would make a noble addition to the collegiate endowment.

NEW JERSEY.

In February, 1888, the trustees of *Princeton College* accepted the resignation of President McCosh, and Dr. Francis Landey Patton, D. D., LL. D., was unanimously chosen as his successor. At the special request of the committee on the presidency Dr. McCosh consented to remain at the head of the college until the commencement in June, by which arrangement the Senior class were able to realize their desire of having his signature upon their diplomas. It was also provided that Dr. McCosh should remain at the head of the school of philosophy, which he has successfully organized, and should receive an honorarium of two thousand five hundred dollars a year in recognition of his valuable services.

In his address at the opening of the fall term for the present year Dr. McCosh stated that during his nineteen years' connection with the college the number of students had increased from two hundred and sixty-four to nearly six hundred, and the teaching force from sixteen or seventeen to forty professors and tutors. "The standard of admission," he said, "is more rigid, yet in advancing it we have been careful to exclude none who are worthy but have had few advantages." He expressed the opinion that "the best American colleges have almost reached the apex of their high standards of admission. Princeton in the future will strive not so much to raise the standard before entrance as to attain higher planes of knowledge after a student is fully initiated into the intricacies of a college course." "We have added," he continued, "new courses from time to time, as they have permanently proved their usefulness and established themselves in the minds of thinking people. New fields have been opened in science, literature, philosophy, and art, and to keep abreast of the times we have enlarged these departments to such an extent that in the variety of subjects offered and the thoroughness of the teaching we are excelled by the German universities alone. And they surpass us only by virtue of minuteness of detail and attention given to specialties."

Prior to his resignation Dr. McCosh submitted a report to the board of trustees advising that the name of the institution be changed to Princeton University. This change would be in the line of the developments which are rapidly taking place in the college.

A number of new fellowships were created in 1887, and the trustees have approved the plan for a new art school, and set aside a site for it and for a proposed biological laboratory.

Dr. Patton, who succeeds Dr. McCosh, occupied for several years the chair of "Relations of philosophy and science to the Christian religion," in Princeton Theological Seminary, and a few years ago accepted also the "chair of ethics" in the college.

Rutgers College, New Brunswick, comprises a classical department and a scientific school, which last is, by act of the Legislature, constituted the State College for the promotion of Agriculture and the Mechanic Arts.

In his return to this Office for the current year President Gates says: "Certain regular sources of income to the college can not be classed as 'productive funds,' because not owned in fact by the college, while yet they have all the certainty and regularity of

income from invested funds. The State holds in trust for the college \$116,000, and income from regular sources as well as from invested funds (apart from the temporary gift of \$7,000 a year for five years) represents an investment of about seven hundred thousand dollars. This does not include, of course, the 'Hatch bill' appropriation of \$15,000 per annum. In addition to this friends of the college have pledged \$7,000 a year for five years towards its 'running expenses.'"

The session of 1887-88 marks the one hundred and nineteenth year of the college and the sixth of President Gates' administration.

NEW YORK.

The University of the State of New York comprises, according to the latest report of that body, thirty-eight colleges, universities, and professional schools. Of this number seventeen would properly be included in Table 49, or represented therein by a department. All of these have reported to this Office for the current year.

The relation to the university stimulates the work of the colleges in various ways. It secures an interchange of opinions on the part of college officers and professors as to methods of instruction and discipline, material appliances, and other conditions of excellence, and excites them to a generous rivalry in the endeavor to secure that public recognition upon which the institutions depend for patronage and endowment.

The university examinations of secondary schools assist materially in keeping up the standard of the Freshman classes and in bringing about uniformity in admission requirements in the colleges of the State.

The reports received at this Office for the current year show vigorous and successful activity on the part of the colleges of the State. These indications are found chiefly in particulars included in the statistical record.

The following additional particulars have been supplied by letter or printed report:

In his report for the current year, Dr. Charles Kendall Adams, the president of *Cornell University*, notes the following among many interesting particulars relating to the progress and work of the university:

From a comparison of the statistics of the past four years it appears that the attendance has risen from four hundred and sixty-one to one thousand and twenty-two, while the number of scholarships has increased from one hundred and eighty to three hundred and twenty-seven. In other words, the rate of increase in the number of paying students has been more rapid than that of non-paying. The rate of increase for women students has been a little above the rate for men.

Efforts have been made within the last two years to regulate a little more carefully than heretofore the method by which students are admitted from approved secondary schools. After careful examination of the record of students in successive Freshman classes the faculty have determined not to admit candidates upon the regents' pass-cards unless the applicants hold also the diploma indicating that the studies of the preparatory school have been completed.

Notwithstanding the building operations of the last two years, serious difficulty is felt in the effort to accommodate the great number of students. The departments of chemistry and physics have been so much crowded that much of the instruction has had to be duplicated the past year. The rapidly increasing attendance also creates a demand for an increase in the teaching force. In discussing this necessity President Adams presents the following important considerations as to the relative strain of different kinds of instruction upon the teachers' energies. "If too many hours of class-room work are demanded of the teacher his energies become relaxed and the quality of his instruction is thereby impaired. If, on the other hand, he is employed for a fewer number of hours than he can practically give without depleting his energies and thus injuring the quality of his instruction, the system imposes a needless drain upon the treasury of the university. The effort, therefore, should be to secure the golden mean between the two extremes. As to the number of hours a teacher should be employed in the class-room no inflexible rule can be given. There are some kinds of work that are vastly more exacting than others. An instructor who lectures, who is obliged to prepare the material which is to be presented to his classes from day to day in order to bring it to them with reasonable freshness, and in a manner to produce the strongest and deepest impression, might, even though he were to lecture but three or four times a week, give more real work to the university than another instructor who should spend his time for the most part, either in teaching the elements of a language or in guiding students in their investigations in a laboratory, even though he were to give to the important work of instruction twenty or even thirty hours a week. This is but another way of saying that in some of the courses and methods of instruction it is necessary that the teacher should do his principal work in his own private study, while in others it is necessary that he should do nearly the whole of it in the presence of his pupils. These considerations

make it absolutely impossible to lay down any general rule as to the number of hours that instructors should devote to their work. Indeed, I know of no rule that can be applied, except the one that the number of hours should be regulated in each individual instance by the determination to get the largest and best results possible from the teaching force employed."

The large increase in the number of students also suggests the advisability of raising the requirements for admission in some of the courses.

The endeavor to provide for the wants of worthy students who can not possibly complete a four years' course has led to the arrangement of optional courses with admission requirements below the regular standard. "If," says the president, "students of this class are qualified to enter the different courses which are taught mainly by lectures, no very considerable addition to our teaching force would be required by their presence; but large numbers of them enter the courses in French and German, where the class has to be divided into small sections, and consequently their presence has formed an important element in the necessity of increasing the teaching force in those departments. While it is true that a considerable number of this class of students enter the university every year with a view to making up the deficiencies in their preparatory course, and ultimately acquiring a full standing in the class, it is at least doubtful whether it would not be advantageous, even to the students themselves, if we were to require that they should fully complete their preparation before they are admitted to university classes.

"The embarrassment experienced has been further increased by another fact of a similar nature. In some of the courses a knowledge of French and German is required of applicants for admission. In other courses the requirements are of another kind. It is therefore necessary to teach certain of our students the elements of French and German. When, therefore, a student having inadequate knowledge of French or German applies for admission to one of the courses in which those languages are required, a strong pressure has been brought to bear upon the faculty to permit students with such deficiencies to enter the beginning classes in those languages, and thus complete in the university the requirements for admission. This is not an unusual practice in American colleges, but it is a practice which, in my opinion, can only be justified by peculiar circumstances. If the teaching force is so large and the attendance of students so small as to make additional numbers in the classes desirable, such a method may be advantageous to the students without imposing any special disadvantage upon the university. But if any such condition ever existed at this institution, it is certain that it exists no longer. The faculty in the course of the past year have had this subject in all of its phases under careful consideration, and have decided, first, that after 1889 no students will be admitted to optional courses, excepting on condition of having passed an examination for admission to some one of the courses leading to a degree; and, secondly, that no student having deficiencies at the time of admission will be allowed to make up those deficiencies by entering any classes in the university. While this legislation will tend somewhat to reduce the number of the entering class, it will, on the other hand, tend, by securing students of greater maturity, to improve the grade of scholarship. It will also remove the cause of a very prevalent complaint that the university has constantly tended to draw away from the preparatory schools a number of students before their work of preparation was completed. That the legislation of the faculty on this subject has been wise, it seems to me will admit of very little question. The university ought not to put its vast material equipment and its other facilities for advanced instruction to doing the work of the preparatory schools. Nor ought it to encourage pupils to leave the preparatory schools before they are fully equipped for entering upon the higher work of the university."

Considering the very elaborate provision made by the university for instruction in the various subjects relating to agriculture, President Adams advises that these be incorporated into a college to be known as the College of Agriculture.

The subjects which he would have included are general and experimental agriculture, agricultural chemistry, botany, veterinary science, entomology, and horticulture.

The great importance attaching to the study of political economy and finance, and the interest which has been excited in the instruction in these subjects provided by the university during the past forty years, has led to the establishment of a professorship of political economy and finance, to which chair Prof. E. Benjamin Andrews, LL. D., has been called. Professor Andrews has occupied the chair of history and political economy at Brown University, where he has achieved marked success.

A school of law has been opened in the university during the year under review, and also a school of pharmacy.

Dr. F. A. P. Barnard, president of *Columbia College, New York*, in his report for 1887-88, discusses as usual many conditions having an important bearing upon the general progress of higher learning.

The total attendance in all departments of the college for 1887-88 was the largest hitherto recorded; as compared with the attendance of last year it showed an increase of sixty-one students.

The working system.—With reference to a change in the working system President Barnard observes: "In past years it has been customary to present a statement of the relative scholarship of the students in the School of Arts at the close of each year. This has been founded on the results of a system of marking for the values of scholastic performances of the students in the several departments. As much dissatisfaction has been expressed by both students and faculty with this artificial method of estimating merit, it has been resolved to try the experiment of discontinuing the numerical marking system, and in place of it require semi-annual reports from each instructor, of the names only of those who are proficient in each study, and of those who are deficient; in order to provide honorable distinction to the most meritorious, each head of department is required to report at the close of the final examination in each year the names of those students, not exceeding three in number, who, in each class, have displayed the greatest excellence in the studies of his department; and any student who is so reported as proficient in all departments is to be reported as an honor man. The names of the honor men are to be recorded in the register of the ensuing year. This plan having been introduced in the course of the current year, the results will not be reported until the close of the final examination, and will be given in succeeding reports hereafter. Thus far the plan seems to be regarded as likely to prove successful."

Latin and Greek electives.—The elective system was adopted by Columbia more than twenty years ago. At present all the studies of the Senior year are elective, while about one-third of the time of the Juniors is appropriated to electives. It follows that certain studies will be elective by both Seniors and Juniors, and others by Seniors only.

The following table shows the proportion of each class choosing Greek and Latin in 1887-88:

	Seniors.	Juniors.	Total.
Number in class	48	44	92
Number electing Greek	12	4	16
Number electing Latin	28	20	48

In addition to this elective work, Latin and Greek are each compulsory upon the Junior class for two hours weekly throughout the year.

The expansion of the professional and other associated schools is an interesting and significant fact in the recent history of Columbia College.

The graduate department, which originated nearly twenty years ago in the system of prize fellowship established, was formally constituted in 1880. The school of political science, created at the same time, makes provision for the subjects which in foreign universities are included under the "philosophical faculty." These two departments, with the school of library economy, opened in 1887, and the professional schools, "fall," observes Dr. Barnard, "in the province of university instruction, and there is, therefore, in the inevitable drift of things, a tendency to concentrate our energies upon the graduate department." "This," he says further, "has been so distinctly perceived by the trustees that there has been a distinct effort made from time to time to convert Columbia College altogether into a school of post-graduate instruction. About thirty years ago this effort assumed the form of a publicly declared purpose, and after a very elaborate investigation resulted in the constitution of a definite university organization. The time was not ripe, however, for so large a step of progress, and the effort failed to prove a success. Out of it, however, grew the Law School, which, meeting a well-ascertained public want, proved immediately successful and has been permanently maintained. Some years later the School of Mines appealed to a public want similarly ascertained, and was accordingly in like manner successful. The operations of the institution have in recent years extended over so wide a field that the original college has been entirely overshadowed, and a doubt has been raised whether its usefulness has not ceased. A resolution is now pending before the board inquiring whether it is not advisable that the whole scheme of education in Columbia College should be raised to a higher plane, and which involves the further question whether it is not advisable to discontinue the department of arts. So long as this question remains under discussion before the governing board, it would not be becoming in the undersigned to pronounce an opinion upon it here. It may be permitted, however, to say in this place, that if the question were merely as to the sufficiency and importance of the work proposed, there could be no doubt that our faculties could find ample and adequate occupation if they were confined to giving instruction exclusively

to graduate students. On the other hand, such has been the excessive multiplication of undergraduate colleges in our country in recent years that the business of those colleges is greatly overdone, and it would certainly be a material benefit to the educational interests of our country if a large proportion of the existing colleges could be suppressed.

* * * "New York City has about a million and a half of inhabitants. It should be capable of furnishing, therefore, at the ratio of 1 to 2,500, six hundred undergraduate students in arts. This is not a number greater than could be comfortably provided for in a single college. Nevertheless we have three, not counting the minor colleges under the care of the fathers of the Roman Catholic Church. It would not be, therefore, educationally a misfortune if Columbia College should cease to exist as a school for undergraduate students. The city would still be fully supplied with educational advantages, while there could be no doubt that this institution could be more profitably employed by confining itself to the field of superior education. Whatever be the policy pursued in this matter, nevertheless it is the unavoidable tendency of things to press upon Columbia College more and more constantly from year to year the duty of providing for the wants of the superior class of students, that is to say, the business of proper university instruction. The location of the institution in the greatest city of the continent is peculiarly favorable to such an undertaking, and, though the college is not possessed of funds sufficient to enable it to carry out this complete design, it is hardly to be doubted that provision may, sooner or later, become sufficient to accomplish this object."

The success of the School of Library Economy is evidenced by the fact that the applications for admission were so numerous as to call for the exercise of considerable severity in the selection.

Though the students had been promised only three months' tuition, at their unanimous request the time was extended to four months. The value of the instruction to the students may be judged by the fact that before the close of the brief session of the school last year every student attending was already under solicitation for appointment to some place worth accepting as a librarian or assistant librarian in some desirable locality in the country.

The advantage of the increased accommodations of the School of Medicine was seen in the greatly increased attendance, which exceeded that of 1886-87 by two hundred and three.

The School of Law has been marked during the past year by an apparent recovery from the temporary depression which had followed the adoption of the rigorous rules in regard to admission to the bar imposed by the judges of the court of appeals, and the attendance has once more nearly reached the extraordinary totals of the years 1875 and 1876.

The scheme of extending the course of instruction to a longer period, which has been so long under consideration, although not yet definitely decided on, has been the subject of careful consideration by a select committee, and will probably be effected and carried into operation during the ensuing session.

The remaining associated schools have maintained their usual efficient operations throughout the year. In addition to the summer classes in surveying, mechanical engineering, and practical geodesy, connected with the school of mines, a summer class in chemistry was held for the first time in the session of 1887.

Dr. Robert B. Fairbairn, president of St. Stephen's College, Annandale, writes in his return to this Office that "the college was begun and founded under the auspices of the Episcopal Church, in the diocese of New York, for the classical training of young men intending to enter the ministry." It is entirely classical, no theology being taught.

The charge for board, washing, fuel, lights, and partly furnished rooms is \$225 per year. The income from this source maintains the current expenses of the college. There is no other charge. The salaries of instructors are furnished by the trustees.

Dr. D. H. Cochran, president of the *Brooklyn Collegiate and Polytechnic Institute*, calls attention to the fact that the greater part of the students leave at the end of the third year, receiving a diploma for which only one modern language is required. To obtain the degree of B. A. or B. S. requires at least five years in the college department. In the degree courses two languages are included.

"The greater part of our students leave at the end of the third year in collegiate department, receiving our diploma, for which only one modern language is required. To include both languages, French and German, it will require at least five years in collegiate department to get degree of B. A. or B. S. The work in modern languages extends through five years,—three years daily recitations, two years every other day.

"The test required for graduation is to put a page of ordinary journalism, not simple narrative, into good French and German at sight, and to speak the languages fluently and correctly."

Nelson F. Robinson, secretary of the *St. Lawrence University*, Canton, states that two years ago four hundred and fifty persons subscribed \$51,088 for the endowment of the

college. About twenty-six thousand dollars have been subscribed by various benefactors upon a second fifty thousand dollars endowment fund on condition that the whole sum projected is raised.

At the twenty-ninth annual commencement, held June 27, 1888, President Gaines resigned the presidency after seventeen years of service: Rev. Almon Gunnison, D. D., pastor of All Souls Church, Brooklyn, was elected his successor, but has not yet signified whether or not he will accept the office.

Hamilton College, Clinton, has just completed the Knox Hall of natural history, which makes an important addition to its excellent equipment for instruction in science. "Through the liberality of the late Hamilton White, of Syracuse, the college collections in natural history have been enriched by the herbarium collected by the late Dr. H. P. Sartwell, of Penn Yan, and well known in scientific circles as a very extensive and valuable exhibition of our North American flora. This herbarium is the result of fifty years of botanical study, research, and correspondence. It contains eight thousand samples of plants skilfully cured, accurately labeled, and conveniently classified in sixty-two handsome volumes.

"Judge Thomas Barlow, of Canastota, has supplemented the recent gift of his large and valuable entomological collection by an almost equally valuable collection in ornithological and comparative anatomy. The college collections are now very extensive and of great importance, because so fully representing the fauna of central New York. Among the many and interesting specimens is one array, probably unique. Side by side are three generations of the seventeen-year locust (*cicada septendecim*, Linn.), collected by Judge Barlow, and from the same locality on the 12th of June, 1845; the 11th of June, 1865, and the 17th of June, 1882."

Madison University, Hamilton, has recently completed a new chemical laboratory valued at twenty-five thousand dollars.

This university has "opened its doors wide to the young men of New York, New Jersey, Connecticut, Massachusetts, and Vermont by establishing competitive examinations for free tuition scholarships, in charge of committees located at various central points. The examinations will be opened to all Christian young men fourteen years of age and older, resident within the territory covered by the committee."

The University of Rochester has received during the year benefactions amounting to \$108,074. This includes fifty thousand dollars from D. A. Watson, Esq., for the professorship of political economy.

Among recent additions to the equipment of the university is a chemical laboratory erected at an expense of twenty-five thousand dollars by Mortimer F. Reynolds, Esq., president of the Rochester Savings Bank, in memory of his brother, the late W. H. Reynolds, Esq., a member of the university board of trustees.

The library of Prof. Von Ranke, of Germany, which has been secured by *Syracuse University*, includes upwards of fifty thousand volumes. Though the larger part of these volumes are historical, there are rare and valuable works on almost every branch of literature. The collection is said to be especially complete in its representation of the great authors and thinkers of Germany. In the collection are a number of Von Ranke's manuscripts; a portrait of the historian, other paintings by German artists, and the desk, chair, and inkstand used in his study.

The University of the City of New York is to have two new chairs established. One will be of English, an anonymous friend of the university having pledged three thousand five hundred dollars per annum for five years for its support; the other will be of history, the Alumni Association of the university having arranged for the maintenance of such a fellowship.

NORTH CAROLINA.

The University of North Carolina, Chapel Hill, has completed nearly a century of honorable history, having been chartered in 1789. The trustees, upon whom the work of organization devolved, were among the most distinguished citizens of that day. As stated in the current catalogue, Samuel Johnston, one of the first Senators of the United States from North Carolina, was chairman. Governor Benjamin Smith was the first benefactor, giving twenty thousand acres of land in Tennessee. The most active worker for the new institution was William Richardson Davie, called the "Father of the University," afterward Governor of the State and Commissioner to France.

On October 12, 1793, annually commemorated as "University Day," the corner-stone of the Old East Building was laid. The buildings are now nine in number, with ample dormitories, recitation rooms, laboratories, and public halls, situated in a campus of fifty acres, covered with forest trees, and adjoining over five hundred acres of university woodland.

The university includes undergraduate and post-graduate departments and a law school. While maintaining the usual curriculum of classical colleges, it has developed a particularly strong course in English language and literature. The provision for bringing the advantages of the university within the reach of all worthy but poor students deserves special mention. The annual fee and tuition amount to but seventy dollars, and board may be had at prices ranging from eight to thirteen dollars a month. The entire annual expense need not, therefore, exceed three hundred dollars and may be reduced to two hundred.

The late B. F. Moore, of Raleigh, bequeathed to the university five thousand dollars, the interest of which is to be devoted to paying the tuition of students.

The Deems Fund was instituted by the Rev. Dr. C. F. Deems, pastor of the Church of the Strangers, New York, as a memorial of his son, Lieut. Theodore Disosway Deems, who was born at Chapel Hill while his father was in the faculty of the university. It is intended to assist needy students by loans. In 1881 this fund was greatly enlarged through the munificence of Mr. William H. Vanderbilt. On the 1st of February, 1888, there were notes, the principal of which amounted to \$13,060.50, representing current loans to students. To that date one hundred and ten students had been helped by the fund. As payments are made new loans will be made to applicants who meet the requirements. They must come with good recommendations for character; or, if members of the university, must have demonstrated to the faculty that they are worthy of assistance. The loans are made at six per cent interest, on satisfactory security, and for a sufficient length of time to make the payments easy.

Miss Mary Ruffin Smith, of Orange, has left a valuable tract of 1,440 acres of land in Chatham County, known as the Jones Grove Tract, the income of which, or of the proceeds if sold, shall be used for the education of such students as the faculty may designate.

Part of this income will be available during the ensuing autumn.

Davidson College, Davidson, reports an increase of \$7,500 in its scholarship funds through the liberality of friends.

The catalogue of *Trinity College, Trinity*, for the current year gives the following particulars relative to the organization of the work:

"The plan of reorganization of Trinity College, submitted to the board of trustees and approved by them (May, 1888), provided that the preparatory department be henceforth abolished, the commercial department be incorporated into a regular college course, and the requirements for admission to the college be gradually raised.

"As now organized the college is divided into two distinct departments, the academic and the scientific, each two years in length, and together constituting a four years' college course.

"The former corresponds to the Freshman and Sophomore years in American colleges.

"The studies of this department form three separate and independent courses, viz.: The classical course, in which Latin and Greek are the distinguishing features; the modern course, distinguished by French and German, and the English course, in which no language except English is required.

"The quantity of work and topics of study are fixed, except that in the English course book-keeping and commercial law may be substituted for pedagogics and drawing, the latter studies being especially adapted for teachers in the public schools and the former suited particularly for such as may after leaving college enter mercantile life.

"These courses have in common an equal amount of pure mathematics, history, and English.

"Each student is required to take one and may not take more nor less than one of the three academic courses.

"The scientific department corresponds in time and work to the Junior and Senior years of American colleges. It is divided into schools capable of indefinite expansion numerically, each extending through two full years without any very marked line of division between them. These schools are so organized as to give a limited amount of connected work in the continuous and progressive study of particular subjects for two years. Each school comprises one or more courses of two years requiring from two to four hours of recitations or lectures per week."

OHIO.

The year has been marked by special activity on the part of the friends of liberal education in Ohio, which is doubtless due in part to the stimulating influence of the centennial celebration of the first settlement of the North-West Territory.

As observed by Dr. Fairchild, president of Oberlin College, in a recent article: "With three exceptions the colleges of the State have come into existence under the impulse of denominational interest and need, except as local enterprise or individual

ambition has operated here and there." The same agencies have sustained the work to the present time, manifesting themselves with renewed vigor during the current year.

By reference to Table 49 it will be seen that the total benefactions to colleges in the State during the year amounted to \$450,072, distributed among twelve institutions.

The State appropriations were \$19,400 to the Ohio State University at Columbus and \$5,000 to Ohio University at Athens.

The *Ohio State University, Columbus*, reports several changes in its able faculty, a number of professors having resigned to accept positions elsewhere. Their successors have been carefully chosen, and it appears that the reputation of the teaching force will be well sustained. The need of larger resources for the rapidly increasing demands of the university is urged upon the Legislature and upon individual patrons of learning in the State. In particular the desirability of substituting a fixed and permanent tax for the uncertain State appropriation, which is the main support of the university, is presented.

The department of physics has secured valuable additions to its equipment during the year.

The department of history and English language and literature has also been divided; history and political science forming one division under Professor Knight, and English language and literature a second, under Professor Welch.

The introduction of the course designed for original study and research in the institutional and financial history of the United States has proved eminently successful. It is believed to be the first experiment of the kind in Ohio. The work has been facilitated by the addition to the library of many valuable books and documents relating to American history.

The catalogue of *Buchtel College, Akron*, for 1887 makes mention of the following donations:

On June 23, 1887, at the graduating exercises, Hon. J. R. Buchtel, of Akron, made the largest and most generous donation which the college has ever received, amounting to \$174,400.

By the will of Mr. Henry Ainsworth, of Lodi, Ohio, who died July 31, 1886, the college is made a residuary legatee of his estate, and will probably receive therefrom not less than twenty-five thousand dollars. This last gift of Mr. Ainsworth swells the total sum of his donations to the college to over seventy thousand dollars, and makes him its most liberal benefactor, its generous founder only excepted.

Prior to the death of Lydia A. E. Messenger, in January, 1887, she gave five thousand dollars to the college, to be added to the Messenger Fund.

In July last two generous friends of the college and of education, Hon. George W. Crouse and Mr. Ferdinand Schumacher, both of Akron, each gave five thousand dollars for the erection of a gymnasium, which is now nearly completed, and will be known as the Crouse gymnasium. Mr. Buchtel's subscription to the fund for this building was one thousand dollars; and by means of these and other subscriptions from friends the finest gymnasium in the West will soon adorn the grounds.

Other donations to the amount of five thousand three hundred dollars are recorded.

The *University of Cincinnati* reports that in the restoration of the university building after the late fire the department of physics has been supplied with entirely new and commodious quarters.

The new chemical laboratory is of ample size, occupying the greater portion of the upper story of the university building, and is well provided with the requisite appliances and facilities for the easy and rapid execution of analytical and experimental work.

The libraries of *Adelbert College, Cleveland*, and of its literary societies contain about twenty-five thousand volumes. Large accessions have been made during the past year; the largest in the purchase of the private library of the late Prof. Wilhelm Scherer, of the University of Berlin.

Mrs. Samuel Mather's gift of two thousand dollars has been applied to the completion and binding of sets of American and English periodicals, and to the purchase of the following classes of works:

- (a.) English, French, and German bibliography.
- (b.) English, French, and German encyclopædias.
- (c.) Biographical dictionaries.

(d.) Dictionaries of modern languages, and the publications of the Early Text Society for the last ten years.

- (e.) Atlases and illustrated works on history and art.

- (f.) Miscellaneous works, mostly of a reference character.

Mr. and Mrs. C. W. Bingham have furnished the money (about \$450) for the purchase, during the last summer, of the great publications by the German Government of the re-

sults of excavations at Olympia and Pergamon. These supply generous material for the illustration of Greek and Roman art and archaeology.

The excellencies of the college library thus consist at present in a good bibliographical collection, complete sets of many valuable literary and scientific serials, a very full department of German language and literature, and a large list of current periodicals.

The Ohio Wesleyan University, Delaware, appears to be entering upon a new building era. Plans for a new gymnasium have been adopted, and a building fund accumulated. Meanwhile the grounds in the south-east portion of the college campus have been graded and put in excellent condition for out-of-door sports. This has been done at an expense of nearly two thousand dollars, most of which has been met by the contributions of students themselves, together with the faculty.

Considerable progress has been made during the year in providing for the proposed new music and art hall, for which purpose a donation to the amount of fifteen thousand dollars has been received from Calvin Whitney, Esq., of Norwalk, Ohio.

The pressing need of a new chapel has been recognized by friends of the university, one of whom offers ten thousand dollars toward the building, provided a sufficient sum is raised for this object within eighteen months.

Assurances have been made by other parties enough to indicate that the church and the constituency of the university are ready to give their means for this purpose.

Peculiar interest centres in *Marietta College* on account of the historic associations which cluster around its location, and the part which it has borne in promoting the cause of learning in the State.

Marietta received a full college charter in 1835, although, like all pioneer institutions, it was forced to make provision for preparatory work. The purpose of marking distinctly the line between this and college work, and of maintaining the traditional college standards, was from the first steadily pursued. The preparatory work has developed into Marietta Academy, one of the best secondary schools in the country. It derives strength and character from the supervision of the college faculty, but has a sufficient staff of instructors to prevent drawing upon the college professors for routine work. The school has proved a valuable feeder to the college and has assisted materially in keeping up the standard of the Freshman class.

Within the past few years the college curriculum has been modified and extended in accordance with the best conceptions of liberal culture combined with due considerations of the college resources, and the requirements of its field of operations.

Progress is reported in the course provided for graduate students.

In the case of non-resident students, three years of study, completing a course marked out by the faculty and pursued under their direction, together with the presentation of a satisfactory thesis, entitles college graduates to enter an examination on the same for the degree of doctor of philosophy. Three years is the minimum time required of non-resident candidates, and in the case of students not well prepared to enter on a chosen course, or whose occupation is too exacting, the term of candidacy will need to be prolonged.

It is understood that the degree will be given only on the ground of high attainment in some branch of knowledge, manifested both by examination and by a thesis showing original investigation or original treatment of a subject.

The expenses at Marietta are moderate and generous; provision has been made by means of prizes and scholarships for worthy students who have not the means to defray the expenses of a liberal education.

The general catalogue just published shows a total of five hundred and eighty-two graduates from 1835 to 1887, inclusive. Of these one hundred and seventy-six became clergymen.

During the current year substantial additions have been made to the college library. The college has an able faculty, and under the presidency of the Hon. John Eaton has the promise of advance in all the conditions of material prosperity and scholastic efficiency. It is worthy of note that the number of college students has increased eighty per cent. during Dr. Eaton's administration.

Altogether, upwards of seventy-five thousand dollars have been added directly, or certainly assured, to the funds of the university during the year.

The report of *Oberlin College* affords the following particulars: "When Oberlin celebrated its semi-centennial in 1883 its buildings were utterly inadequate to the work. Four years have witnessed a remarkable change. Six important buildings, five of them stone, have arisen, and there is still the prospect of a fine memorial building to be erected on the site of the old homestead by Mr. F. N. Finney, of Milwaukee, Wis., to the memory of his father, the late President Finney.

"When completed Warner Hall will extend one hundred and fifty feet on Professor Street and one hundred and twenty feet on College Street. The more important of the wings, containing the Concert Hall, is in process of erection. It is the gift of Dr. and

Mrs. Lucien C. Warner, of New York City, who have expended upon this central portion about forty-two thousand dollars, to which must now be added something more than twenty-five thousand dollars, the cost of the new wing."

In addition to his gifts of money, "Dr. Warner has given his personal attention to every detail of the plans and has made the contracts with the builders. Probably no important building ever cost the college officers less anxiety and care, and certainly no building has proved better adapted to its use. It is practically four stories in height, which stories are made accessible by easy and well-lighted flights of stairs and also by an elevator, which is kept constantly running. Here will be found a delightful and ample entrance hall, offices, library, rehearsal rooms, lesson rooms, and practice rooms. But the building is serving a higher and nobler purpose than is indicated by these arrangements. Before its erection there was a growing feeling that Oberlin might have something of a mission in preventing that divorcement between musical culture and spiritual culture which seems to threaten on every hand. The traditions of the place, the presence in large numbers of both sexes, and the counter-balancing influences of other forms of culture gave Oberlin the greatest advantages in attaining this high ideal. But this building, more than anything else, has given a visible shaping to these thoughts in the minds of all and has been the direct means of the adoption of the Conservatory of Music by the trustees as an integral part of the university work at Oberlin College."

Wittenburg College, Springfield, reports that the new building begun in 1883 is finished and has been occupied since the beginning of the present collegiate year. It is a large, well-lighted structure, admirably adapted for college purposes.

PENNSYLVANIA.

Table 49 presents the statistics of twenty-four colleges and universities of Pennsylvania, whose reports for the most part show that the year has been one of successful operation. The total of gifts and benefactions received was \$524,280, distributed among seventeen of the institutions.

The following are the most important particulars of the year's record beyond the information included in the tabulation:

The advance of the *University of Pennsylvania, Philadelphia*, is perhaps the most notable fact in the recent history of superior education in the State.

The graduates at the commencement, June, 1887, outnumbered those of any previous year, not including the medical school, which has its separate commencement. The enrolment of undergraduates for the present year is slightly in excess of the preceding year, and the total enrolment exceeds that reported for 1886-87 by one hundred and thirty-four.

The increase in equipment, especially in the higher departments of science, the expansion of the advanced course, the incentives to research which are offered, the high reputation of the professional schools of the university, are conditions which explain its rapidly increasing influence and reputation.

A new and extensive library building for the university is in contemplation; the estimated cost is about one hundred and fifty thousand dollars.

The university sustained a severe loss during the year by the burning of the medical hall. Medical collections of great value and many rare works of art were destroyed.

The amount of donations and bequests reported is upwards of ninety-seven thousand dollars. The purposes to which these are to be applied are specified in a subsequent table.

The large benefactions reported this year by Swathmore College, viz, one hundred and sixty thousand dollars, are for the endowment of four professorships.

The *Western University of Pennsylvania, Allegheny City*, has a productive fund of two hundred and seventy-five thousand dollars, the income of which is devoted to meeting current expenses, thereby reducing the rates of tuition, which range from sixty to eighty dollars per annum.

The university has a fine observatory, which was in charge of the distinguished scientist, Dr. Samuel P. Langley, until November, 1887, when he resigned to assume the position of Secretary of the Smithsonian Institution at Washington. In his report dated May 23, 1888, Dr. Langley states that the routine observations for the time service have been continued in the hands of Mr. Very, who has been instructed in past years in all the methods devised by Dr. Langley until he has become extremely skilful in their application. Dr. Langley expresses the belief that there is no observatory anywhere whose system surpasses that of the Western University in its practical convenience, in the accuracy of its results, and in the simplicity of the methods for making them useful to railroads, cities, and the public generally.

Muhlenberg College, Allentown, has always maintained a strong work in the classical and in the modern languages. Greek and Latin are both required for the A. B. degree, and the German language and literature are included in the regular course.

Of fifty thousand dollars donated to the college during the current year ten thousand were to be added to the endowment of the Greek professorship.

The Catalogue for 1887-88 of *St. Vincent's College, Beatty*, records the death of the Arch-Abbott Boniface Wimmer, O. S. B., the founder of St. Vincent's Abbey and College. His death, which occurred December 8, 1887, closed forty-one years' active service in the cause of Catholic education in the United States.

Dickinson College, Carlisle.—Through the liberality of Hon. Jacob Tome, of Port Deposit, Md., a new scientific building has been erected for Dickinson College, which adds greatly to the facilities for science instruction.

The James W. Bosler Memorial Library Hall has been completed, and supplies provision which the college has long needed. In this hall the valuable libraries of the college have complete protection and all requisites for convenient use and proper display.

The hall contains also an audience-room having a seating capacity for about eight hundred persons. The want of such a room has been a serious inconvenience in the past. A third addition to the equipment of the college is a new gymnasium, supplied with the most approved appliances. A competent director has been placed in charge and the college is now fully prepared for the important work of physical culture.

The trustees of the *Pennsylvania Military Academy, Chester*, have appointed Col. Charles E. Hyatt to the presidency, made vacant by the death of his father, Col. Theodore Hyatt. Having been associated with his father in the conduct of the work for sixteen years, Colonel Hyatt brings to the presidency a full understanding of the policies which have proved eminently successful in the past history of the academy. In his report for the current year Col. Charles Hyatt announces that after 1891 the degree of civil engineer will give place to that of bachelor of civil engineering, and that a post-graduate course will lead up to the former degree after 1891.

Lafayette College, Easton, presents in its able faculty and splendid equipment for science instruction provision for full-rounded, symmetrical education. The undergraduate may choose from six courses. Three of these are general, viz: classical course, leading to the degree of A. B.; Latin scientific to the degree of B. Ph.; general scientific to the degree of B. S.

Three of the courses are technical as follows: Civil engineering, leading to the degree of C. E.; mining engineering and metallurgy, leading to the degree of M. E., and a special course in chemistry, leading to the degree of B. S. in chemistry.

Post-graduate courses are also maintained in philology, physics, chemistry, biology, etc.

The increase of appliances which has been a marked feature of the recent history of Lafayette has been accompanied with a development of the curriculum, the extent of which may be inferred from the fact that the old Lafayette course of two thousand and seventy recitations and lectures has developed into nine thousand two hundred and sixty-three. This progress has been made without any sacrifice of logical consistency in the arrangement of studies or of thoroughness in their pursuit.

Lafayette enjoys peculiar distinction for the conduct of physical culture and for the application of the scientific method to linguistic studies.

Of one hundred thousand dollars donated to *Pennsylvania College, Gettysburg*, during the year thirty thousand are to be applied to the endowment of the chair of mental and moral science, fifteen thousand are for a memorial chapel, and twenty thousand for a new hall.

Grove City College, Grove City, reports the completion of the new building begun in 1886. Provision has been made in this for the scientific department and two gymnasiums, one for either sex.

Dr. Thomas Chase, president of *Haverford College, Haverford*, resigned in October, 1887, on account of impaired health. This act severs an official connection extending over thirty years. President Chase is a man of ripe scholarship and sound judgment, and under his guidance the college has achieved an enviable reputation for thorough instruction and efficient discipline. At the time of his resignation President Chase was travelling abroad, his place being temporarily filled by Dr. Pliny E. Chase, a member of the faculty. The death of the acting president occurred in December, and the selection of a new president claimed the attention of the managers. After careful deliberation the choice fell upon Isaac Sharpless, who, for several years, had served as dean of the faculty. President Sharpless was inaugurated on the 19th of May.

Several important accessions have also been made to the faculty during the year.

The David Scull Fund, which became available during the current year, has been applied to the endowment of the professorship of biology. The amount thus far received is thirty-four thousand dollars, to which six thousand will shortly be added.

The debt of the corporation, which, at the close of the last fiscal year had been reduced to six hundred and ninety dollars, has been entirely extinguished.

Bucknell University, Lewisburg, has received from Mr. William Bucknell, of Philadelphia, a gift of twenty-five thousand dollars, which will be used in enlarging the present buildings. The demands of the art and music departments will be specially considered in the new structures.

"The university as now organized comprises three departments: The college, for young men who wish a full course of study; the academy, for young men or boys preparing for college, for teaching in the public schools, or for business; and the institute, for young women. These three departments occupy separate buildings, but are under one corporation and have one president, and hence enjoy the advantages of inter-relation and co-operation without the disadvantages of too close connection."

Central Pennsylvania College, New Berlin, has been organized as a college for one year only. Pending the securing of an endowment fund it is supported by contributions from churches of the Evangelical Association.

RHODE ISLAND.

Brown University, Providence, has received gifts and bequests during the year to the amount of \$137,229. Of this sum \$100,000 are to be applied to the building of a physical laboratory, \$1,000 to the gymnasium fund, and \$5,990 to the endowment of a professorship of natural theology.

The spirit of toleration which characterized the original settlers of the State is stamped upon the university charter, which requires Baptists, Congregationalists, Episcopalians, and Quakers to be represented in specified numbers in its government.

SOUTH CAROLINA.

In December, 1887, *South Carolina College* was enlarged into the University of South Carolina, at Columbia, with a branch at Orangeburg (Claffin University).

In his message to the General Assembly covering the operations of 1887-88, Governor Richardson makes the following statement with reference to the reorganized institution: "To meet the wants of all classes of our people provision was made in the amended charter for a graduate department, a college of agriculture and mechanic arts, a college of liberal arts and sciences, a college of pharmacy, a normal school, and a law school. The details of organization were left to the board of trustees of the university. The work of preparation has been diligently pushed, and the institution stands to-day complete in all its departments. In the selection of officers and teachers attention was largely directed to ability and special training; in the arrangement and adoption of courses of study and methods to thoroughness of instruction.

"The graduate department offers forty-two advanced courses of study, covering a wide range of subjects. The college of agriculture and mechanic arts, with its twenty-three teachers, its eleven carefully formulated courses for degrees and certificates, its numerous and well-equipped laboratories and shops, its farm, its appliances and ample provision for practical training, is an admirably organized and most promising school of technology. The college of liberal arts and sciences has eighteen teachers and four four-years' courses for degrees, each covering twenty-three special courses of three hours each per week in its several departments of instruction. The institution offers, in all its departments, one hundred and forty-eight courses, and has twenty-one lecture rooms and fourteen laboratories, in addition to twenty-seven other rooms used as shops, draughting-rooms, halls, and other public purposes—or sixty-two rooms in all. Every building has been repaired and improved, infirmaries and new offices have been erected, and the grounds put in excellent condition. It is not too much to assert that in the ability of its teachers, its well-arranged courses of study and methods of instruction, the completeness of its outfit, and the beauty of its situation and buildings, the university is one of which any State might be proud, and stands second to none in the South. Indeed, by competent judges outside as well as inside the State, it is already accorded such position. Its claims to excellence of work are established by the records of its recent graduates. Several of these are at the head of some of the most important secondary schools in the State. Some have firmly established themselves in scientific pursuits. Seven are now engaged as analytical chemists in private and collegiate laboratories. Others are engineers, geologists, farmers, etc. The institution is now attracting students from beyond our limits."

In the reorganization of the institution, the faculty has been enlarged, the additional members having been carefully selected with a view to maintaining the reputation which the college has always enjoyed on account of the ability of its teaching force.

The Rev. J. W. Flinn has been called to the chair of moral philosophy and the chaplaincy. He is a graduate of the University of Mississippi and of the Theological Seminary of Columbia, S. C. After the completion of his studies in the United States he made a special study of philosophy at the University of Edinburgh, under the famous Dr. Calderwood and Dr. Fraser, and of English literature under Professor Masson.

The chair of Latin has been filled by Dr. J. S. Murray, who left the profession of the law to devote himself to classical study. He pursued his studies at Johns Hopkins University, under the guidance of Dr. Gildersleeve, subsequently at the universities of Göttingen, Leipsic, and Berlin. At the last named he passed four years in an advanced course of study in classical philology.

Dr. E. W. Davis, who takes the chair of mathematics and astronomy, is a graduate of the University of Wisconsin, and Doctor of Philosophy at Johns Hopkins.

The arrangements made for the development of the scientific department show a determination on the part of the trustees to keep in line with the rapid advance of science in the South. The chairs of botany and zoölogy, of agriculture, and of analytical chemistry have all been filled by men who have had exceptional opportunities for study and research in their specialties, and who come to the university with established reputations. A chair of pedagogics has been established, to which the trustees have called Dr. E. E. Sheib, of Baltimore. This gentleman took the degrees of M. A. and Ph. D. at Heidelberg, and will undoubtedly exercise a great influence upon the teachers of the South through his conduct of his department of the university.

The development of South Carolina College for some time past has been largely in the direction of applied science. The mechanical department is very well equipped, and it is hoped that under the university organization the material appliances will be greatly increased. The trustees appeal to the Legislature and to the friends of learning in the State to follow up the work so auspiciously begun by the pecuniary appropriations necessary for its maintenance upon the same plane.

The several departments of the newly organized university, from which returns have been received, are tabulated in this Report as follows: The college of liberal arts, Table 49; Claflin University, Table 55; the law school, Table 67.

TENNESSEE.

The University of Tennessee, Knoxville, has elected Prof. F. L. Scribner, of the Agricultural Department, Washington, to fill its chair of botany and horticulture; Prof. H. E. Summers, of Cornell University, to the chair of zoölogy and entomology; and Prof. William E. Stone, of Göttingen, Germany, to be chemist at the Tennessee experiment station. All these are said to have accepted the positions offered, and will, doubtless, inspire the university with new life.

Bishop H. N. McTyeire, chancellor of *Vanderbilt University, Nashville*, reports the completion of a new building for law and dental departments, erected in the central part of the city, and a new building for mechanical engineering in the college campus. The latter affords provision for the improvement and enlargement of the department specified, for which purpose, and the increase of the library, the university has received during the year from William C. Vanderbilt, of New York, a gift of thirty thousand dollars. At their annual meeting, June 15, 1887, the trustees of the university resolved to discontinue all classes below the regular collegiate department. The maintenance of such classes, at first a necessity from the lack of good preparatory schools, is no longer deemed necessary. The trustees also appointed a committee to report on the advisability of admitting young women to equal privileges with young men.

Carson College, Mossy Creek, has recently opened a department of systematic theology in the interests of young men wishing to prepare themselves for the Christian ministry, but who can not conveniently attend a theological school.

Fisk University, Nashville, has made a good beginning in securing the necessary apparatus for illustrating the various branches of natural science. Laboratory work in elementary chemistry and mineralogy is now systematized and established, and it is hoped that similar opportunities may soon be afforded students in physics, elementary anatomy, and physiology, and eventually in astronomy.

A convenient and ample room contains a well arranged collection of over three thousand specimens in natural history, geology, mineralogy, and ethnology.

The reorganization of *Grant Memorial University, Athens*, has enabled the trustees to greatly strengthen the faculty and to offer courses of study equal to the high and well-balanced standards adopted by the first-class schools of our country and demanded by the culture and practical tendencies of the age. Beside important revision of the courses in liberal arts, philosophy, and science, a new department has been established with full courses in technical science. These courses have been carefully prepared with special reference to laying a broad, substantial foundation of technical and general knowledge, necessary for the successful prosecution of all the agricultural, mechanical, and scientific professions. They will be open this year to all students prepared to enter the Freshman classes.

The professional departments have been materially strengthened and the courses of study carefully revised.

During the past year very large additions have been made to the facilities of the natural science department, and the classes have had the benefit of practical instruction in

all branches of physical science and natural history. Apparatus and material costing over three thousand dollars have been procured and conveniently arranged for systematic use.

The new edifice for *Hiwassee College* is beautifully finished but not fully furnished. New halls have been fitted for the literary societies; the old halls, now used for recitation purposes, making more room—a necessity long needed.

The University of the South Sevanee, reports encouraging prospects in the number of students and the increasing facilities for study. The new gymnasium and chapter house is a substantial stone structure. Other new buildings are contemplated.

TEXAS.

In their report for 1888 to the Governor of the State, the regents of the *University of Texas* present a complete statement of the condition and needs of the institution, of which the following is a brief résumé.

The endowment consists of bonds, land notes, and lands. The present value of the bonds held in trust by the State is \$549,300, yielding an annual interest of \$33,267.

The land notes held in trust by the State show a total of \$68,120.50 unpaid balance, on which the annual interest is \$4,636.11.

From first to last the university has received grants of land as follows: By act of Congress approved January 26, 1839, fifty leagues; one million acres set apart by the constitution of 1876; and one million appropriated by act approved April 10, 1883. The greater part of the original fifty leagues has been sold and converted into bonds and land notes; of the first grant of one million acres, 12,480 acres have been sold and 92,157 acres are under lease; of the second million acres none has been leased or sold.

"This," the regents observe, "is an unsatisfactory showing, and they urge that it is desirable to put those lands as fast possible in such a shape that an income may be derived from them. This they believe can be most readily done by placing the sale and lease of the lands in the hands of the regents." In support of this view they urge the fact that every other State which maintains a State university has turned over the lands appropriated for its support to the university authorities.

As regards the present condition of the university there is pressing need for funds for the completion of the building; for the equipment and strengthening of chairs already established in the academic department; for the creation of additional chairs; for the expansion of the law department, and for the organization of the medical department.

As the present income of the university, viz, \$44,919.39, is totally inadequate for these purposes, the regents ask an annual appropriation from the State until the fund from the endowment shall suffice to maintain the university on the basis originally contemplated. Twenty thousand dollars per year for several years would enable the university to bridge over what threatens to be a crisis in its history, and enable it to grow in strength and usefulness; and for this amount, therefore, the regents ask.

The South-western University, Georgetown, opened a new department for the accommodation and education of young ladies in 1878. "The prosperity of the enterprise and the increasing demand for a regular boarding department for young ladies have resulted in the erection of a complete female college building, with every facility and appliance for the higher education of women."

VERMONT.

The University of Vermont and State Agricultural College, Burlington, has a choice and extensive library containing twenty-three thousand seven hundred volumes, beside the eleven thousand seven hundred and seventy-five volumes that form the library of the late George P. Marsh, a collection of the highest value in the departments of philology, European literature and history, and physical geography. This collection is the gift of the Hon. Frederick Billings, of Woodstock. The library has now been carefully arranged by subjects, on the Dewey system, and accession and shelf catalogues have been written. A card catalogue on the dictionary plan is in progress, six thousand eight hundred and twenty cards having been prepared.

The commodious and beautiful "Billings Library," in which the books are stored, was erected at a cost of \$115,000. The apse, in which the Marsh collection is at present shelved, having become desirable as a reference and reading room, Mr. Billings this year generously increased his gift to \$150,000 by providing for the Marsh library an additional room even more elegantly appointed than the main building. The library is open seven hours a day for consulting and drawing books. The reading room is supplied with all the leading scientific and literary periodicals. Persons not connected with the university have free use of the books for consultation, and, on special permission from the president, are allowed to take them home. Students of the university, as residents of the city, have also use of the Fletcher Free Library, a choice collection of over seventeen thousand volumes, for loan and reference, which is open daily."

VIRGINIA.

The colleges of Virginia stand deservedly high for the scholarly attainments of their professors and the high standards of their literary and ethical courses. The University of Virginia may claim to have taken the lead in this country in according full recognition to the physical sciences, but the colleges of the State have been less favored than those of other States in respect to funds for the development of scientific departments.

The general failure of the colleges of Virginia to report the value of their scientific apparatus (see Table 49, Column 31) is calculated, however, to give an exaggerated idea of their deficiency in this respect.

The scientific equipment of the *University of Virginia* is very complete and valuable.

Since 1866 the following schools have been established: The School of Applied Mathematics, created first as an adjunct to the School of Mathematics, and subsequently as an independent school; the School of Analytical Industrial and Agricultural Chemistry; the School of Agriculture, Zoölogy, and Botany; the School of Practical Astronomy, in connection with the Leander McCormick Observatory; the School of Natural History and Geology, and the School of English Language and Literature.

The School of Agriculture, Zoölogy, and Botany has an endowment of one hundred thousand dollars derived from the liberality of Samuel Miller, Esq. The endowment of the School of Natural History and Geology, amounting to fifty thousand dollars, was the gift of Mr. W. W. Corcoran.

From this brief outline it will be seen that the university is well prepared to meet the requirements imposed by the advance in scientific knowledge and in the application of science to the industrial arts.

Emory and Henry College, Emory, reports that funds are being raised for the erection of a science hall, which will probably be completed during the present year. It will contain a laboratory, chemical and philosophical lecture rooms, and cabinet of minerals, and will greatly increase the facilities for science instruction. A gymnasium is also being erected in the college campus.

The gifts and bequests of Cyrus H. McCormick, Esq., to *Washington and Lee University*, amounting to forty thousand dollars, have been applied to the endowment of the "McCormick" professorship of natural philosophy.

The professorship of applied chemistry is established upon a fund of \$42,600, the bequest of Robert H. Bayley, Esq., of New Orleans, La., who died in 1872. The university has a fine museum of natural history and an excellent collection of scientific works in its library. Substantial additions have lately been made to the scientific apparatus.

Richmond College, Richmond, celebrated, September 22, 1887, the formal opening of the new museum and art hall, a memorial of James Thomas, Jr., the constant friend and benefactor of the college. Mr. Thomas's family have given ten thousand dollars to found "The Thomas Museum Lecture Endowment," the income of which is to be used annually in securing a course of lectures on subjects relating to science, to philosophy, or to art.

WEST VIRGINIA.

The University of West Virginia, Morgantown, includes a preparatory school, the usual courses of collegiate study, the classical and scientific, a military department, a law school, leading to the degree of bachelor of laws; a school of civil engineering. The current catalogue reports a school of engineering established by the board of regents June, 1887.

WISCONSIN.

Dr. Thomas Chowder Chamberlin entered upon the presidency of the *University of Wisconsin* at the beginning of the scholastic year 1887-88. Notwithstanding an advance in the entrance requirements the attendance exceeded that of 1886-87. The president's report presents comparative statistics of the attendance upon the different colleges and courses, as shown by the classification of students for 1886-87 and 1887-88 and for the first term of 1888-89, with the design of showing the intellectual tendencies of the university. From this analysis it appears that the humanity courses take precedence of the physical science course.

On the basis of unit exercises a week their relative position is as follows:

Studies.	Unit Exercises per Week.	Percentage Ratios.
Humanity.....	26,355½	57.95
Physical science.....	19,122½	42.05
Total.....	45,478	100.00

Among other indications of the growth and vigor of the university must be noted the establishment of new courses and departments.

Pre-medical course.—At the request of the Wisconsin State Medical Society a course in science, with collateral branches, is arranged especially for those contemplating the study of medicine and surgery.

Normal graduate course.—To bring the university into better working relationship with the State normal schools and to offer their graduates facilities for extending their studies advantageously, two special courses, admitting of a large measure of modification by election, have been framed and offered by the university, and have already been selected by a sufficient number of normal school graduates to indicate that the provision meets a real educational want.

Pre-legal and pre-journalistic courses.—A two years' course of study had previously been offered for the accommodation of those contemplating the study of law or journalism. This has been developed into a group of courses, intended to constitute the work of the Junior and Senior years and to be based upon the work of the Freshman and Sophomore years of the classical and English courses. The courses thus contemplate a higher and broader culture than before, and are intended to enable students to secure the chief objects sought in a college course while at the same time they are definitely preparing the way for their future professional study.

Additional languages.—Three additional languages have been offered, namely, Sanscrit, Italian, and Spanish, and classes have been formed in all.

New departments.—A chair of experimental and comparative psychology has been established, and a laboratory is being fitted up for this new and important line of research.

The gymnasium building of *Racine College, Racine*, an ample structure containing all necessary apparatus for healthful exercise, as well as a thoroughly furnished laboratory and art studio, was unfortunately destroyed by fire on the night of February 14, 1888.

The friends of the college immediately rallied for its relief, and funds are being rapidly supplied for the restoration of the building. The loss to the college, it is stated, could not be replaced by twenty thousand dollars, although the commercial value would not permit a greater than five thousand five hundred dollars insurance on the building and contents.

The prospect for a complete restoration of the building, with enlargements, is already so flattering that the trustees of the college have begun the work of securing material, and it is expected to have the new building in readiness for occupancy by the opening of the Christmas term.

La Grande, Oregon.....	Blue Mountain University..	Mail returned.
Monmouth, Oregon.....	Christian College.....	Discontinued.
Jefferson, Pa.....	Monongabeia College.....	Discontinued.

DISTRIBUTION OF COLLEGE STUDENTS BY STATES.

In response to repeated calls for the information, Table 51 has been prepared, showing the distribution of college students by States.

The data have been drawn from the catalogues of two hundred and eighty-eight colleges, which publish the residences of their students. In all but thirty-one cases the catalogues were for the year 1887.¹

In twenty-five cases the catalogues of 1885-86 were employed; in five those of 1884-85, and in one case the catalogue of 1888.

Students in preparatory and professional departments have been excluded save in the case of nine colleges, where distinction was impossible. In these, however, the majority of the students were known to be collegiate.

The totals in Column 57, Table 51, show the number of students attending the colleges of the respective States.

The total at the foot of each column shows the number of students attending college from the State whose name heads the column.

Reading the table from left to right the entry in each column shows the number of students in the colleges of the State named at the left of the line to be credited to the State named at the head of the column.

Reading down a column the entries show in what States the students credited to the State whose name appears at the top of the column are attending college.

Table 50 presents in a somewhat condensed form the particulars given in Table 51. Column 2 shows the number of college students credited to each State, and Column 3 the ratio of the same to the college population. Column 5 shows the total number of students in the colleges of each State so far as known to the Office. The remaining columns show the geographical distribution of the students attending the colleges of the several States. By reference to Table 51, it appears from Column 57 that there were 432 students attending colleges in Maine. Reading from left to right it appears that 373 of these were credited to Maine, 29 to New Hampshire, 2 to Vermont, 15 to Massachusetts, etc. Again, the total at the foot of Column 3 shows that Maine furnished 496 college students. Reading down the column it appears that 373 of these were attending colleges in Maine, 17 in New Hampshire, 63 in Massachusetts, etc.

¹ This includes 1886-87, 1887, 1887-88.

SCHOOLS OF SCIENCE ENDOWED BY THE NATIONAL LAND GRANT.

REMARKS ON TABLE 52.

Table 52 presents the summarized statistics of thirty-two institutions endowed by the land grant of 1862. To these must be added the Oregon State Agricultural College at Corvallis, which reports no particulars beyond the fact that the present is the first year of its existence as an independent agricultural college, and fifteen departments of agriculture and the mechanic arts, whose work cannot be exhibited separately from that of the universities of which they are parts (vid., p. 736).

This gives a total of forty-eight institutions that have received the benefit of the national land grant of 1862.

Thirty-eight of these institutions have an officer of the Army or Navy detailed to act as professor of military science and tactics in accordance with the statute¹ providing for such detail. Where a State has more than one school endowed by the national land grant of 1862, the school which is reported by the Governor of the State as most nearly meeting the requirements of existing law is held to have the first claim to the officer allotted to the State. So far not more than one detail for land-grant institutions has been made to a single State, so that five local departments in Georgia and one school in each of the following States, Massachusetts, Mississippi, Missouri, South Carolina, and Virginia, have not received the benefit of the law.

¹ [Extract from the Revised Statutes of the United States as amended by the act of Congress approved September 26, 1888.]

Sec. 1225. The President may, upon the application of any established military institute, seminary or academy, college or university, within the United States having capacity to educate at the same time not less than one hundred and fifty male students, detail an officer of the Army or Navy to act as superintendent, or professor thereof; but the number of officers so detailed shall not exceed fifty from the Army, and ten from the Navy, being a maximum of sixty, at any time, and they shall be apportioned throughout the United States, first, to those State institutions applying for such detail that are required to provide instruction in military tactics under the provisions of the act of Congress of July second, eighteen hundred and sixty-two, donating lands for the establishment of colleges where the leading object shall be the practical instruction of the industrial classes in agriculture and the mechanic arts, including military tactics; and after that, said details to be distributed, as nearly as may be practicable, according to population. The Secretary of War is authorized to issue, at his discretion and under proper regulations to be prescribed by him, out of ordnance and ordnance stores belonging to the Government, and which can be spared for that purpose, such number of the same as may appear to be required for military instruction and practice by the students of any college or university under the provisions of this section, and the Secretary shall require a bond in each case, in double the value of the property, for the care and safe keeping thereof, and for the return of the same when required: *Provided*, That nothing in this act shall be so construed as to prevent the detail of officers of the Engineer Corps of the Navy as professors in scientific schools or colleges as now provided by act of Congress approved February twenty-sixth, eighteen hundred and seventy-nine, entitled "An act to promote a knowledge of steam-engineering and iron-ship building among the students of scientific schools or colleges in the United States;" and the Secretary of War is hereby authorized to issue ordnance and ordnance stores belonging to the Government on the terms and conditions hereinbefore provided to any college or university at which a retired officer of the Army may be assigned as provided by section twelve hundred and sixty of the Revised Statutes.

Endowed with the National Land Grant for 1887-88.

	1			152	0	7,500	3,025	546,866	502,253	27,277	22,329		180,205	
	609	7		2,334	91	221,963	915,507	5,541,146	10,261,624	649,523	512,319	233,814	1,555,507	163,000

The conditions brought to view by the statistical records of two successive years show comparatively little change in the status of a class of institutions like those under consideration. The total of State appropriations for 1887-88 exceeds the amount reported in 1886-87 by \$114,481.

Omitting Oregon, whose agricultural college makes no report this year, fourteen States made larger appropriations than in 1886-87, their excess amounting to \$161,707. Eight States made smaller appropriations, the total decrease for these being \$44,755. This shows for the States represented both years a net increase of \$116,952 in State appropriations.

Of the total income reported, viz, \$1,555,507, productive funds yielded 41.75 per cent.; State or municipal appropriations, 32.93 per cent.; tuition fees, 15.03 per cent., leaving a small portion unaccounted for.

The total of benefactions received by these institutions in 1887-88 amounted to \$163,000, divided among four institutions, as against \$302,810 in 1886-87, which was distributed among nine institutions.

PROGRESS IN FIVE YEARS.

In the case of individual institutions, the detailed statistics reported in one year vary but little from those of the next year. The changes that take place during a term of years are more significant.

The following tabulation shows the relative status of twenty-six land-grant colleges as regards increase or decrease in the number of instructors and students, and the value of productive funds according to the statistics reported in 1882-83, and in 1887-88.

The Florida State Agricultural College has been organized during the period, and consequently does not appear in this study. The five colleges of Georgia are also omitted, as changes that have taken place in their organization would make the comparison misleading. It is hoped that the data for completing this view and extending it through the successive years may be secured in time for use in the next Report.

DISTRIBUTION OF STUDENTS IN PRACTICAL WORK AND IN DEGREE COURSES.

Table 54 shows the distribution of the students in the land-grant colleges in the various lines of practical work as reported to this Office the present year, and also the distribution of the students in the collegiate departments in the several degree courses.

It will be observed that the totals in the second column, which have been used as the basis in determining the percentages of students in practical work, include all students, while the totals in the twentieth column, used as the basis of the second series of computations, include only the students in the collegiate department.

The nineteenth column of the table shows the status of military tactics in the college; V, indicating that the exercise is voluntary; O, obligatory, and N, no information.

EFFECT OF THE HATCH ACT.

The appropriation of \$15,000 to each State by the General Government* for the maintenance of experiment stations has had a very stimulating influence upon the agricultural departments of the colleges here considered.

An inquiry as to the relation of the colleges with the State stations was included in the forms issued for them the present year. The information thus elicited is here summarized:

Name.	The Status of Land Grant, Agricultural and Mechanical Colleges with respect to Experimental Stations.
State Agricultural and Mechanical College (Alabama Polytechnic Institute).	Station established by college; enlarged by Hatch fund.
Arkansas Industrial University	None.
University of California (College of Agriculture).	Conducts experimental station with aid of State appropriations.
State Agricultural College (Colorado).	Under Hatch act, Feb., 1888, station united with central station at college; four auxiliary stations established elsewhere in State.
Sheffield Scientific School of Yale University.	
Delaware College.....	State agricultural station connected with college.
State Agricultural College (Florida)...	State agricultural experiment station under provisions of the Hatch bill.
State College of Agriculture and the Mechanic Arts (University of Georgia).	
South-west Georgia Agricultural College.	
North Georgia Agricultural College...	None.
West Georgia Agricultural and Mechanical College.	
Middle Georgia Military and Agricultural College.	
South Georgia College of Agriculture and the Mechanic Arts.	
University of Illinois.....	State agricultural experimental station, a department of the university; president of university presiding officer; working forces distinct.
Purdue University.....	Station established at university.
Iowa Agricultural College.....	Under Hatch bill, experimental station, a department of the college.
Kansas State Agricultural College....	Station a department of the college, under a council of professors.
Agricultural and Mechanical College of Kentucky.	Agricultural experimental station a department of the college; established in 1885.
Louisiana State University and Agricultural and Mechanical College.	State experimental station located on college grounds.
Maine State College of Agriculture and the Mechanic Arts.	State experimental station under Hatch bill, a department of the agricultural department of the college.
Maryland Agricultural College	Agricultural experimental station under college trustees; president of college director; other officers, and also funds, distinct.
Massachusetts Agricultural College...	No relations except president of college and two trustees, members of board of control.
Michigan State Agricultural College..	State experiment station, a department of the college under Hatch bill; governed by State board of agriculture; president of college, director.
University of Minnesota.....	University professor of agriculture, director of station; staff and equipment enlarged under provision of Hatch act.
Agricultural and Mechanical College of the State of Mississippi.	State agricultural experiment station a department of the college.
Alocorn Agricultural and Mechanical College (Mississippi).	
Missouri Agricultural and Mechanical College (University of Missouri).	
Missouri School of Mines and Metallurgy (University of Missouri).	
Industrial College of the University of Nebraska.	Connected with station.
University of Nevada	Connected with station.
New Hampshire College of Agriculture and the Mechanic Arts.	Station part of the college, funds separate and devoted to purposes indicated in Hatch bill.
Scientific School of Rutgers College..	Station in part under same management as college; distinct organizations and lines of work.
Cornell University	Appropriations under Hatch act given in charge of university for purposes specified.
Agricultural and Mechanical College of the University of North Carolina.	Connected with station.
Ohio State University	Connected with station.

* For the full provisions of the Hatch act, authorizing the appropriation, see p. 729.

Name.	The Status of Land Grant, Agricultural and Mechanical Colleges with Respect to Experimental Stations.
State Agricultural College (Oregon)..... Pennsylvania State College	Station a distinct department under Hatch act, aided by State appropriations; part of the station staff connected with college faculty.
Brown University	State stations distinct from college.
South Carolina College of Agriculture and Mechanic Arts.	None.
Cladlin University	Connected with station.
University of Tennessee and Agricultural and Mechanical College.	Agricultural experiment station a department of the college.
State Agricultural and Mechanical College of Texas.	.
University of Vermont and State Agricultural College.	Station a department of the college.
Virginia Agricultural and Mechanical College.	None.
Hampton Normal and Agricultural Institute.	Connected with station.
West Virginia University	
University of Wisconsin, College of Arts.	

THE HATCH BILL.

[Approved March 2, 1887.]

AN ACT to establish Agricultural Experiment Stations in connection with the colleges established in the several States under the provisions of an act approved July 2, 1862, and of the acts supplementary thereto.

SEC. 1. *Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,* That in order to aid in acquiring and diffusing among the people of the United States useful and practical information on subjects connected with agriculture, and to promote scientific investigation and experiment respecting the principles and applications of agricultural science, there shall be established, under direction of the college or colleges, or agricultural department of colleges, in each State or Territory established, or which may hereafter be established, in accordance with the provisions of an act approved July 2, 1862, entitled, "An act donating public lands to the several States and Territories which may provide colleges for the benefit of agriculture and the mechanic arts," or any of the supplements to said act, a department to be known and designated as an "Agricultural Experiment Station:" *Provided,* That in any State or Territory in which two such colleges have been or may be so established, the appropriation hereinafter made to such State or Territory shall be equally divided between such colleges, unless the Legislature of such State or Territory shall otherwise direct.

SEC. 2. That it shall be the object and duty of said experiment stations to conduct original researches or verify experiments on the physiology of plants and animals; the diseases to which they are severally subject, with the remedies for the same; the chemical composition of useful plants at their different stages of growth; the comparative advantages of rotative cropping as pursued under a varying series of crops; the capacity of new plants or trees for acclimation; the analysis of soils and water: the chemical composition of manures, natural or artificial, with experiments designed to test their comparative effects on crops of different kinds; the adaptation and value of grasses and forage plants; the composition and digestibility of the different kinds of food for domestic animals; the scientific and economic questions involved in the production of butter and cheese; and such other researches or experiments bearing directly on the agricultural industry of the United States, as may in each case be deemed advisable, having due regard to the varying conditions and needs of the respective States or Territories.

SEC. 3. That in order to secure, as far as practicable, uniformity of methods and results in the work of said stations, it shall be the duty of the United States Commissioner of Agriculture to furnish forms, as far as practicable, for the tabulation of results of investigation or experiments; to indicate, from time to time, such lines of inquiry as to him shall seem most important; and, in general, to furnish such advice and assistance as will best promote the purposes of this act. It shall be the duty of each of said stations, annually, on or before the first day of February, to make to the Governor of the State or Territory in which it is located, a full and detailed report of its operations, including a statement of receipts and expenditures, a copy of which report shall be sent to each of said stations, to the said Commissioner of Agriculture, and to the Secretary of the Treasury of the United States.

SEC. 4. That bulletins or reports of progress shall be published at said stations at least once in three months, one copy of which shall be sent to each newspaper in the States or Territories in which they are respectively located, and to such individuals actually engaged in farming as may request the same, and as far as the means of the station will permit. Such bulletins or reports, and the annual reports of said stations, shall be transmitted in the mails of the United States free of charge for postage, under such regulations as the Postmaster-General may from time to time prescribe.

SEC. 5. That for the purpose of paying the necessary expenses of conducting investigations and experiments, and printing and distributing the results as hereinbefore prescribed, the sum of \$15,000 is hereby appropriated to each State, to be specially provided for by Congress in the appropriations from year to year, and to each Territory entitled under the provisions of section eight of this act, out of any money in the Treasury proceeding from the sales of public lands, to be paid in equal quarterly payments on the first day of January, April, July, and October in each year, to the treasurer or other officer duly appointed by the governing boards of said colleges to receive the same, the first payment to be made on the first day of October, 1887; Provided, however, that out of the first annual appropriation so received by any station an amount not exceeding one-fifth may be expended in the erection, enlargement or repair of a building or buildings necessary for carrying on the work of such station; and thereafter an amount not exceeding five per centum of such annual appropriation may be so expended.

SEC. 6. That whenever it shall appear to the Secretary of the Treasury from the annual statement of receipts and expenditures of any of said stations, that a portion of the preceding annual appropriation remains unexpended, such amount shall be deducted from the next succeeding annual appropriation to such station, in order that the amount of money appropriated to any station shall not exceed the amount actually and necessarily required for its maintenance and support.

SEC. 7. That nothing in this act shall be construed to impair or modify the legal relation existing between any of the said colleges and the government of the States or Territories in which they are respectively located.

SEC. 8. That in States having colleges entitled under this section to the benefits of this act, and having also agricultural experiment stations established by law separate from said colleges, such States shall be authorized to apply such benefits to experiments at stations so established by such States, and in case any State shall have established, under the provisions of said act of July 2 aforesaid, an agricultural department or experiment station in connection with any university, college, or institution not distinctively an agricultural college or school, and such State shall have established, or shall hereafter establish a separate agricultural college or school, which shall have connected therewith an experimental farm or station, the Legislature of such State may apply in whole or in part the appropriation by this act made, to such separate agricultural college or school, and no Legislature shall, by contract, express or implied, disable itself from so doing.

SEC. 9. That the grants of moneys authorized by this act are made subject to the legislative assent of the several States and Territories to the purpose of said grants: *Provided*, That payments of such instalments of the appropriation herein made as shall become due to any State before the adjournment of the regular session of its Legislature meeting next after the passage of this act shall be made upon the assent of the Governor duly certified to the Secretary of the Treasury.

SEC. 10. Nothing in this act shall be held or construed as binding the United States to continue any payments from the Treasury to any or all the States or institutions mentioned in this act; but Congress may at any time amend, suspend, or repeal any or all of the provisions of this act.

List of Agricultural and Mechanical Colleges whose Work cannot be separated from that of the State Universities of which they are Departments. (See Table 49.)

Location.	Name.
Berkeley, Cal.....	College of Agriculture, Mechanics, Mining, Engineering, and Chemistry (University of California).
Athens, Ga.....	Georgia State College of Agriculture and Mechanic Arts (University of Georgia).
Baton Rouge, La.....	Louisiana State University and Agricultural and Mechanical College.
Minneapolis, Minn.....	College of Agriculture and Mechanic Arts (University of Minnesota).
Columbia, Mo.....	Missouri Agricultural and Mechanical College (University of Missouri).
Lincoln, Nebr.....	Industrial College of the University of Nebraska.
Reno, Nev.....	University of Nevada.
Chapel Hill, N. C.....	Agricultural and Mechanical College (University of North Carolina).
Columbus, Ohio.....	Ohio State University.
Providence, R. I.....	Agricultural and Scientific Department of Brown University.
Columbia, S. C.....	South Carolina College of Agriculture and the Mechanic Arts (University of South Carolina).
Knoxville, Tenn.....	University of Tennessee and Agricultural and Mechanical College.
Burlington, Vt.....	University of Vermont and State Agricultural College.
Morgantown, W. Va.....	Agricultural Department of West Virginia University.
Madison, Wis.....	College of Arts (University of Wisconsin).

The details presented in Tables 52 to 55 make a very full exhibit of the actual work and resources of the land-grant colleges for the current year. They suggest also the varied development of the institutions as determined by locality and resources. The year has, however, been characterized by great activity in respect to many particulars that do not admit of tabular presentation. Information concerning these compiled from reports, catalogues, and other official sources is embodied in the following statements:

Cornell University, which has the largest endowment of any of the land-grant colleges, and is one of the five richest foundations in the country, embraces a full classical and scientific curriculum corresponding to that of the arts colleges in general; five technical courses, graduate courses, and two professional schools. The ample endowment and full equipment of this university, the ability of its faculty, and the scholastic standards maintained, justly entitle it to rank among institutions of the highest order.

Place has been given to it in the special tabulation of foundations comprising groups of faculties or schools. It should be observed, however, that while Cornell consists of schools and colleges bearing distinct names and having distinct functions, as the "Sibley College of Mechanical Engineering and Mechanical Arts," "The College of Agriculture," etc., the students are not matriculated in schools, but are grouped for certain studies, and are under the general direction of a single faculty. To this arrangement the school of law is an exception.

The libraries of the university are three in number: The General University Library, containing 62,000 volumes; the President White Library of History and Political Science, 30,000 volumes, and the Law Library, 4,500 volumes.

The additions to the equipment reported for the present year are seven thousand five hundred dollars from the Hon. Hiram Sibley for Sibley College; eight thousand from Hon. Henry M. Sage, to equip the department of Greek; forty-five thousand from A. S. Barnes, Esq., for Christian Association Hall, and one thousand from Mrs. A. S. Barnes for Shakespeare prize.

LAND-GRANT COLLEGES WHOSE CURRICULA INCLUDE A CLASSICAL COURSE.

Omitting Cornell University, the remaining institutions here considered present a variety of educational schemes, combining general and technical courses in diverse proportions. Six of the number report classical courses leading to the degree of A. B. Among these is the University of Illinois, one of the richest and most highly organized of the land-grant colleges.

Its endowment from the land grant was increased at the first by donations of property by Champaign County valued at above four hundred thousand dollars, and has been further augmented by large appropriations from the State of Illinois.

Successive colleges and schools have been added as required until four colleges, including eleven distinct schools, have been organized.

The present productive fund of the university is exceeded only by that of one other institution in the State, and the value of its property and scientific apparatus by none.

Its domain comprises 623 acres, including stock farm, experimental farm, orchards, nurseries, etc. The buildings are fifteen in number, all appropriated to scholastic purposes, as the university makes no provision for boarding and lodging students. Among

noticeable features in the equipment are the art gallery and the museum of industrial art.

The faculty is large and efficient. The proportion of students taking the classical course has always been small; this year it is less than two and a half per cent. of the entire number.

The remaining land-grant colleges reporting an A. B. course are as follows: Arkansas Industrial University, Delaware College, Southwest Georgia and North Georgia Agricultural Colleges, and the Agricultural and Mechanical College of Kentucky.

These colleges, it will be seen, are in the section of the country in which the movement for scientific and technical training is of recent origin. In common, however, with the other land-grant colleges of the same section they have felt the impulse of the movement, and are making provision for courses in theoretic and applied science as rapidly as circumstances permit.

The trustees of *Arkansas Industrial University* endeavored, from the first, to withstand the prejudices which they encountered against non-classical colleges, and have not ceased to urge upon the State Legislature the need of enlarged appropriations to supply the material appliances for scientific and technical instruction. In 1835 their efforts were seconded by the joint committee of the Legislature; nevertheless that body, as it appears from the report of the trustees for 1836, "limited the appropriations for the two years ending June, 1837, to the estimates submitted for continuing the system of instruction, upon the basis which had been followed substantially from the opening of the institution, namely, the usual curriculum of literary colleges."

In their report for 1836 the trustees say:

"The board, although anxious to take the responsibility and meet the manifest wishes of a majority of the citizens of the State in the matter mentioned, were thus left without adequate means to effect these much-desired reforms. However, they determined to make an effort, and in reorganizing the scientific departments prepared courses of instruction that could be practically utilized in the direction sought.

"By close calculation they were enabled to divert a portion of the general fund at their command and organized, on a limited scale, a manual training school for boys, which they feel satisfied, as far as it has been developed, fully justifies their efforts in that direction. * * * Underlying this department, and as a basis for its future development, a course of free-hand and mechanical drawing was established, and a branch of industrial art for girls connected therewith, and the board feels gratified with the results of this work as far as the limited experiment has been carried."

The report for the present year states that, "in order further to emphasize the agricultural and mechanical departments, the late Legislature, in what is known as the Barker bill, while making a handsome appropriation to each of these leading departments, ordained that all male beneficiaries should pursue one of these courses, restricted the subjects to be taught to beneficiaries, and fixed the number and character of the professorships. The evident design of the Legislature was to respond to the demands and needs of the State, by creating an agricultural and mechanical institution, with such subsidiary courses as the amount of the appropriation would allow. The present board of trustees and faculty of the institution, aware of the necessities of the State, and fully in accord with the policy outlined by the Legislature, have done all in their power, in laying out the appropriation and drawing up the courses of study, to meet the wants, both of the great mass of the people of the State, as well as the minority also, in a subsidiary way. We are fully persuaded that the agricultural and mechanical courses here offered and the facilities afforded by the legislative appropriations will enable us to turn out graduates in these departments that will compare favorably with those of any other school, while at the same time, with little or no additional cost to the State, strong classical and normal courses have been laid down."

LAND-GRANT COLLEGES OFFERING ONLY SCIENTIFIC AND TECHNICAL COURSES.

Twenty-one of the colleges included in Table 55 confine their curricula to scientific and technical courses. The law of supply and demand as affecting the practical character of their work is strikingly illustrated by the recent history of the *Alabama State Agriculture and Mechanical College*. Under the impulse communicated by the development of the rich mineral resources of the State and the sudden expansion of mining and engineering interests within its borders, the college has become a "distinctive school of industrial science or polytechnic institute." Its present organization and equipment were fully described in the Commissioner's Report for 1836-37. The building operations, which, as mentioned in that Report, were begun immediately after the disastrous fire of June 24, 1837, have been vigorously prosecuted. The interest manifested in the work makes it certain that appropriations sufficient for its completion upon the present plans will be forthcoming.

SHEFFIELD SCIENTIFIC SCHOOL.

Recent events in the history of the *Sheffield Scientific School* have brought to light some interesting particulars as to the work of the school, and as to the popular demand for the special instruction for which the Congressional grant was designed to make provision.

In his report for 1887, already quoted, President Dwight, referring to these events, says: "As the result of a misapprehension on the part of some persons as to the exact meaning and intention of the Congressional act of 1862, under which the Legislature of the State of Connecticut gave to the Sheffield Scientific School the income of the fund obtained from the sale of the land scrip which fell to the share of this State, a question was brought before the Legislature, at its session in 1886, as to the propriety of continuing the payment of this income to the school and the possibility of discontinuing it. After a careful examination into the whole subject by a committee of the Legislature, which made its report in 1886, and a full hearing of all parties concerned by another committee in 1887, the Legislature adopted, on the 30th of March in the present year, the following resolution:

"Resolved by this Assembly, That the act entitled an act appropriating to the Sheffield Scientific School of Yale College the proceeds of land assigned to the State by act of Congress approved July 2d, 1862, passed by the General Assembly of Connecticut at the May session of 1863, and approved June 24, 1863, and the agreement of the President and Fellows of Yale College, executed in accordance with the provisions of said act, together constitute a binding contract inviolably securing to said corporation the income of the fund provided for in said act so long as said corporation shall continue on its part to comply with the terms and conditions of said contract."

This resolution was passed by the Legislature without any dissenting voice and was approved by the Governor of the Commonwealth. It is a matter of gratification to the president and fellows, also to the governing board of the school, that the thorough and careful review of the whole subject by the highest authorities of the State, has thus set aside all temporary misunderstandings of the case, and that the contract between the State and the president and fellows has been reaffirmed.

From the annual statement of the governing board of the school for 1886, it appears that the sum realized by Connecticut from the sale of its scrip was \$135,000. By the terms of the contract between the State and Yale College, devoting to the latter the interest of this fund, gratuitous instruction must be furnished by the school to such a number of students from the State as would expend a sum equal to one-half the interest for the year in paying for their instruction were they charged the regular rates. The school has not only acted up to this requirement, but has generally had on its rolls for gratuitous instruction a larger number of State scholars than the complement. With respect to the class of students who have sought the benefit of the provision, the report of the governing board says: "Neither in the studies related to agriculture or the mechanic arts was there at first any wide-spread demand, apparently, for the instruction furnished. Nor need it be denied that in the case of the former this indifference has largely continued. The same causes which have operated to prevent large numbers from pursuing the scientific study of agriculture in every other State have operated here also. Every careful observer sees what they are; they do not need to be discussed in this place. They will become less and less influential with the progress of time, but it will be long before they cease to exert great influence. The result has most certainly been that the school has had but few students who cared to devote themselves to the special study of the science of agriculture.

"But Connecticut is likewise a great manufacturing State. It was not long before the advantages here presented came to the knowledge of the young men who wished to acquire scientific training in subjects related to the mechanic arts. The number of applicants from this source increased rapidly, and speedily took up every free scholarship to which the State was entitled."

A subject of special interest has recently been pressed upon the attention of the governing board; namely, "The addition of a fourth year to the course of study, so as to make the course required for the attainment of the degree of bachelor of philosophy cover the period of four years instead of three, as at present." With respect to this proposition, President Dwight observes: "It would place the degree of bachelor of philosophy, in respect to the matter of time, in the same position as that of bachelor of arts." It is felt by many of the wisest and most thoughtful men in the university, both in the school itself and outside of it, that this addition of a fourth year would be a very desirable addition. A large proportion of the graduates of the school also, as it is believed, are disposed to hope for the addition, and to favor it as soon as the funds at command may render it practicable. After very careful consideration of the subject, however, it is the opinion of the director of the school and of his associates in the governing board—an opinion in which the president concurs—that, in order to a successful meeting of the

demands in the way of additional instructors and other necessary means to the end, a sum of at least two hundred and fifty thousand dollars would be needed, and that, until the funds can be increased by this amount, it would not be in accordance with the best wisdom to make this change. The end is a desirable one, but the movement towards it should be sure and safe. In connection with this prolongation of the course of study, or even before it shall be realized, and as preparing the way for it, the addition of further laboratories and lecture-rooms, already alluded to, will be very desirable, and even essential.

George J. Brush, director of the Sheffield Scientific School, makes the following statement as to its status:

"The Sheffield Scientific School is a part of Yale University, having the benefit to a greater or less degree of its libraries, scientific apparatus, grounds, buildings, etc., and it is under the general management of the president and fellows of the university. The State of Connecticut gives us the income derived from the amount realized from the sale of lands granted by Congress in 1862; this income is now \$6,750 each year. We maintain in the Sheffield Scientific School sixteen (16) professors who devote their whole time to its interests, and besides we employ fifteen other instructors in various subjects taught in the school. This year the amount paid out for salaries of professors and instructors in the Sheffield Scientific School will be \$57,550, and our general expenses amount to about \$7,000, making a total of over \$64,000; and that does not include the cost of management and maintenance of the libraries and museums of the university, the advantages of which we share in common with other departments of the institution."

The *Agricultural and Mechanical College of Mississippi* was opened in 1880. From the beginning the board of trustees determined to make all instruction subserve the leading object defined in the land-grant act, viz, the "promotion of agriculture and the mechanic arts."

Recognizing that the former was, and for many years must continue to be, the main interest of the State, and seeing "the needs of an improved system of agriculture," they concentrated their efforts first of all upon the agricultural department.

The success of the college upon the plan indicated gives particular interest to the report of its operations.

In addition to the college building, professors' houses, etc., the college possesses a well-stocked farm of about two thousand acres, chemical laboratory, and valuable scientific apparatus.

Instruction in the department of agriculture embraces the lectures of the class-room and the "knowledge gained by the student in the regular work of the field and in an intimate association during his whole course with the large and well-equipped farm." The college provides for the student not merely experiment work, but a business farm. He not only has the advantages offered by an experimental farm, but he helps "to cultivate crops varying in extent from ten to one hundred or more acres."

A special course in dairy husbandry is provided, with facilities for practical work in the creamery.

In the department of horticulture instruction is also carried on by lectures and garden work.

In their report, dated July 6, 1887, the trustees state that "the real productive value of the farm has about doubled. This farm has not received a cent from the college fund in three years and annually clears a profit which has been invested in improvements and stock.

"For the support of the college for the years 1886 and 1887, the Legislature appropriated \$50,000; for these two years the college share of the interest on the land-scrip fund was \$9,857; total receipts for the two years \$59,857, making for each year \$29,928, in round numbers \$30,000. During that time the college had 691 students in attendance. Many were turned away in 1886 for want of room to lodge them, and in 1887 as many were turned away as were received, for the same reason."

The actual annual expenses of a student attending the college are estimated at \$124.10, excluding all clothing save the uniform. In the Sophomore year this amount is increased by \$12 for chemicals. This amount may be reduced by the labor of the student. The annual cost to the State for each student exclusive of the amount paid them for labor is estimated at \$232.46.

The trustees find upon inquiry that about fifty-six per cent. of those who have attended the college are engaged in farming.

The land-grant colleges in the group of States formed out of the North-West Territory, with those of Iowa and Kansas, have given special prominence to the agricultural and industrial features contemplated in the land-grant act. The reports of successive years show continuous progress in these respects. As facilities for preparatory instruction are multiplied, the colleges are relieved of elementary work.

Iowa Agricultural College makes a report to that effect the present year, the preparatory class having been discontinued in 1887.

The *Michigan Agricultural College* is enlarging its facilities in the direction of the mechanic arts without diminishing at all the strength of its agricultural department.

Experimental work for the promotion of agriculture and horticulture has been from the first a prominent feature in its course of training. Extensive laboratories in the different departments enable the institution to enter on a series of experiments "to be prosecuted systematically and continuously from year to year. The results of these experiments are published in the monthly bulletins and in the annual report of the State Board of Agriculture."

Purdue University, La Fayette, Indiana, under the vigorous presidency of Dr. James H. Smart, maintains the standards which have placed it among the leading institutions of its class in the country.

The agricultural and mechanical departments are here equally developed. In the former the endeavor is to give complete instruction in the sciences underlying agriculture, to incite students to make original investigations in those sciences, and to afford them opportunity for witnessing and conducting experiments in every department of agriculture directed to the improvement of its processes and the increase and improvement of its products. The appliances for this part of the work include a well-managed farm, experimental field, orchard, greenhouse, cabinet collections, and laboratories.

The mechanical shops of *Purdue University* are among the best in the country. As an evidence of the practical character of their work, may be mentioned the recent construction of forges and other equipment for the new shops of the *Alabama Polytechnic*.

Two States of the South Atlantic section, viz, *Maine, Massachusetts, and Virginia*, and three of the North Atlantic, viz, *Maine, Massachusetts, and Pennsylvania*, have established distinct colleges of agriculture on the land-grant fund.

The chemical department of the *Maryland College* has been recently thoroughly reorganized and supplied with new quarters and equipment.

The *Pennsylvania State College* offers three general and six technical courses. The former include a general course in agriculture adapted to the wants of those who wish to begin the study of the subject immediately after leaving the public schools. The technical course in agriculture makes full provision for instruction in the sciences related to that art, including laboratory work and experimental work on the farm, orchard, vineyard, etc. Notwithstanding the excellence of the course and the very complete facilities for its maintenance the number of students entering this department is small.

The *Massachusetts Agricultural College, Amherst*, reports a year of exceptional prosperity.

In the matter of instruction, the experiment was made of inviting gentlemen not connected with the college to lecture on special topics, the lectures being followed by a general discussion, in which the students participated. Of thirty lectures delivered in this way, fifteen had direct reference to farm, garden, and dairy matters. The remainder were on subjects of general science.

An interesting event in the recent history of the college was the celebration, June 21, 1887, of the twenty-fifth anniversary of the passage of the land-grant act. Commemorative addresses were made by Dr. Charles Kendall Adams, president of *Cornell University*, by Hon. Charles G. Davis, and by Hon. Justin S. Morrill, to whom the country is indebted for the passage of the land-grant act.

The report of Dr. Francis A. Walker, president of the *Massachusetts Institute of Technology*, for the current year is replete with valuable information and suggestion.

The fifty-eight graduates who received the degree of B. S. in May, 1887, found easy admission into the several industrial professions. Dr. Walker says:

"In either chemistry or civil engineering it would have been practicable to place twice as many men as were available in eligible professional positions between the close of the past and the opening of the present year. So great was the demand for members of the graduating class that it was for the first time found impracticable to fill all the vacant assistantships in the several laboratories from our own numbers, and we were obliged in two cases to send to other institutions for men to take these positions, and, in a third case, to appoint one of our special students, not a graduate."

The opening of the school year of 1887-88 witnessed large additions to the number of students, the aggregate being 819 as against 738 the previous year. Omitting, as is usual, the students of the *Lowell School of Practical Design* and the students of the *High School of Mechanic Arts*, the number is 720, as against 637 the previous year. As compared with 1877-78 the increase in number of students is above two hundred and seventy per cent.

"If this remarkable increase," observes President Walker, "had been secured by any lowering of the standard of scholarship, any surrender of the requirements for admission, for continuance in the school, or for graduation from it, that increase of

numbers would not be to me a subject of pride or pleasure; but when I consider that this increase, to nearly fourfold the number nine years ago, has taken place coincidentally with a steady advance in scholarship; that these great bodies of students have come to us well knowing that the Institute is a place for hard study, and cheerfully accepting the conditions which we impose; this, I confess, appears to me a proper subject for congratulation. Not only so, but this readiness and eagerness on the part of so many young men to undertake severe and protracted courses of study, regarding which there can be no pleasing illusions, and which require the entire devotion of time and thought and strength for four years, affords a most gratifying indication of the essential manliness of young men.

"Our experience, at least, furnishes no support to the view that, in order to make a school popular, the requirements for admission or continuance must be placed low, or, if the theoretical standard be high, administrative concessions must be freely made to the spirit of indolence or frivolity, or to the demands of sport or of society. Not only is it true that students, in increasing numbers, come to the Institute in spite of its reputation for hard work, but it is not less conspicuously true that, within the Institute, the students, by a very decided preference, select those courses which are recognized as involving the greatest amount of study and practice. It is also true that within the several courses those options which offer the largest capabilities are those most generally chosen."

Of the total number of students 59.6 per cent. are from Massachusetts, 13.6 per cent. from other New England States, and the remaining 26.8 per cent. from outside New England.

As regards the ages of students upon entrance, the average for the present year is found to be eighteen years five months and seventeen days.

For several years there has been a steady advance in this respect, concerning which President Walker observes:

"This must be regarded as a proper subject of congratulation, when consideration is had of the nature of the work at the Institute, and the immediate entrance which it affords into professional practice.

"It is true that the postponement of the age of entrance has of late caused some apprehension on the part of those who direct the classical colleges of New England, and that serious consideration has been given to various proposed means of meeting this tendency, but their problem is not our problem. In the case of students graduating from classical colleges, there is generally to follow a course of two or three years in professional schools, whether of law, of medicine, or of divinity, which is in turn to be followed by a longer or shorter period—sometimes a long and weary one—of waiting for professional practice. Under these circumstances it is undoubtedly a hardship that the age of graduation with the Bachelor's degree should be postponed beyond the twenty-first, much more beyond the twenty-second, year of life. It is unquestionably true that a young man who commences the full, busy practice of his profession before he is twenty-five years of age has an advantage over one commencing at a later period in the matter of freshness, spontaneity, hopefulness, and enthusiasm.

"In our case the relations of instruction to professional practice are altogether different. A young man who has pursued one of our courses with credit may, if he pleases, enter into the practice of his profession the day after he graduates, often with a choice among several positions offered him. In these circumstances graduation at twenty-two years must be regarded as more fortunate than graduation at an earlier period, while twenty-three or twenty-four years can not be considered as in any sense excessive."

The teaching staff of the institute continues to increase, numbering seventy-five members as compared with sixty-nine in 1886-87. The increase during the decade has been 76 per cent.

By reference to Table 55, Column 31, it will be seen that the productive fund of the Institute is exceeded by that of eight other colleges there tabulated.

In the report for 1886 the president stated that it would require half a million of dollars for immediate and imperative needs, and that it would take a million to place this institution in as good a financial condition as the poorest school of its rank in the United States.

During the present year one hundred thousand dollars have been received by bequest of Richard Perkins, Esq.

The appeal to the Legislature for two hundred thousand dollars was met with the appropriation of half the sum, coupled with two conditions: first, that one hundred thousand dollars from other sources should be added to the funds of the Institute prior to first payment to be made from the treasury, and secondly, that twenty free scholarships should be established and maintained in the Institute upon specified terms.

The first condition has been complied with, largely through the devoted and self-sacrificing labors of Mr. William Endicott, Jr.

The second condition it was found would impose too heavy a burden upon the finances of the school; it therefore seemed best to the executive committee and the finance committee not to draw the first instalment of the State grant until further efforts shall be made to secure the grant of the additional one hundred thousand dollars asked for.

"Should this be secured," says President Walker, "the Institute of Technology will, for the first time, be in a condition to meet its current expenses out of its annual receipts. Such a result would not avoid the necessity for large additional endowments—first, to secure the school against calamity or reverses of fortune; and, secondly, to provide for a continuous future enlargement and improvement of its various services and departments, to meet the ever-growing demands for technical instruction; but it would mark a very important epoch in the history of the Institute of Technology, and would bring an unspeakable relief to the officers and teachers who have so long in penury and straitness of means held up the standard of scientific instruction here amid difficulties and discouragements neither small nor few."

DEPARTMENTS OF STATE UNIVERSITIES ENDOWED WITH THE LAND GRANT.

The fifteen departments of State Universities or other institutions that have received the benefits of the land grant, like the independent colleges of the same class, show various stages and kinds of development. In every case, however, there is the evident intention to carry out the purpose of the act as completely as possible under the existing conditions.

While experience seems to indicate that technical training is most successfully pursued in schools organized for that special work, it is certain that the scientific departments endowed by the land grant are proving themselves to be invaluable agencies for the promotion and diffusion of scientific knowledge and for the training of teachers, investigators, and scientific specialists.

It is further noticeable that in several instances the departments have developed into highly specialized schools in which the industrial applications of science have full representation. This is emphatically the case with the *Rutgers Scientific School*, a department of Rutgers College, New Brunswick, N. J. This school offers the following courses of study: A course of four years in civil engineering and mechanics; a course of four years in chemistry and agriculture; a special course of two years in agriculture; and post-graduate courses. Abundant provision is made for laboratory, farm, and field work.

The *University of Nebraska* includes an "Industrial College," with courses in agriculture and civil engineering. Plans for a veterinary school have also been formed.

The *scientific department* of the *University of California* embraces five colleges, as follows: College of Agriculture, of Mechanics, of Mining, of Civil Engineering, of Chemistry.

Each of these is abundantly supplied with laboratories and other material appliances for instruction.

In addition to the ample provision for observation and practice possessed by the colleges themselves, the opportunity afforded by the great industrial resources and enterprises of the State are made available to the student by organized visits of inspection.

The United States Coast and Geodetic Survey, the surveys and operations of United States engineers in the harbors of the coast, and the extensive works of the hydraulic mines are all used for illustration and instruction.

The *University of Minnesota* has been specially mindful of the provisions of the land grant in its application of the fund.

With respect to agriculture, the report of the regents for 1887-88 states that the board has, "in good faith, from the first, made ample provision to teach such branches of learning as are related to agriculture, and has established a course known as that of the college of agriculture. It is not to be disguised that this course has not been valuable to the industry for which it was intended, but for what reason it is not necessary here to consider.

"Yet, while very few have pursued this course and taken its degree, it would be unjust to assume this as the measure of the contribution which this university makes to agriculture as compared with other institutions known only as agricultural colleges, inasmuch as the subjects of English, mathematics, and the natural sciences, which in the latter are accredited to the agricultural course, are in our university pursued as thoroughly in either of its several courses. Hence we may in fairness ask the friends of agriculture to examine the generous provisions made for the departments of natural history, botany, and geology in the museum and science hall, the last building erected by special appropriation of the Legislature."

The college of mechanic arts has been highly prosperous. "A course in electrical engineering leading to the degree of bachelor of electrical engineering was added at the

beginning of the year 1887-88; the artisans' training school was reorganized and named 'the school of practical mechanics and design;' a new course in the care and management of engines and boilers was added; also a new course in designing and wood carving."

The *University of Wisconsin* has become a recognized force in the promotion of all the various industries of the State. The president reports that "A chair of agricultural physics has been recently established and work inaugurated in it. This chair contemplates both instructional and experimental work, and will constitute a factor of both the agricultural college and the experiment station. This important department of agricultural science has not received the definite recognition which it unquestionably merits, this being the first chair of this kind, so far as known, yet specifically established." The report further states that "the new science buildings have been completed and now afford accommodations unsurpassed in most respects, quite unequalled in some particulars." "Large invoices of physical engineering and other apparatus, very carefully selected from the most approved manufactories, have been received. Typical collections representative of mineralogy, petrography, geology, zoölogy, and botany have been purchased. Judicious selections of laboratory manuals and treatises essential for reference have been purchased for the laboratories."

"One of the most important phases of the recent growth of the university has been the developments of the departments of original investigation and the more explicit recognition of research and of the dissemination of new and more accurately determined knowledge as one of the important functions of the University. The two departments, the Washburn Observatory and the Agricultural Experiment Station, which are devoted almost exclusively to the increase of knowledge, have been provided with additional force and facilities and research has become a factor in several of the other departments."

Nine fellowships have been recently established. "One of these has been founded by the generosity of the Hon. John Johnston, of Milwaukee, in the appointment of candidates to which preference is given to residents of Milwaukee County and to those exhibiting ability and promise in the departments of mechanic arts."

REMARKS ON TABLE 56.

Table 56 presents the summarized statistics of thirty schools of science not endowed with the land-grant act.

Four institutions or departments which formerly appeared in this category are not included in the present table. These are the Industrial Institute and College for Women, Columbus, Miss., which has been transferred to Table 44; the John C. Green School of Science, a department of the College of New Jersey; the Scientific Department of the University of the City of New York; and the Pardee Scientific Department of Lafayette College, whose statistics were not reported separately from those of the foundations to which they belong (Table 49).

The Chaffey College of Agriculture, Ontario, Cal., which did not report in 1886-87, appears in the table for the present year; also the Technical School of Cincinnati, Ohio, which was established in 1886.

The twenty-eight schools reporting both this year and last show an increase of nineteen instructors and one hundred and twenty-nine students. Appropriations to the same show an increase of \$17,065. Benefactions amounting to \$40,465 were received by eight of the schools, as against \$35,260 in 1886-87 distributed among six schools.

The total income so far as reported, viz, \$547,253, represents twenty-two schools. In the case of schools not giving the total income it has been assumed that the sum of items reported in answer to any of the inquiries relative to income would be the total. Of the entire amount tabulated, 12.7 per cent. were derived from productive funds, 42.31 per cent. from State or municipal appropriations, 16.86 from tuition fees, and 28.13 per cent. not specified.

The schools here classed together differ materially in respect to courses and standards of instructors and general aims. For a particular characterization of each the reader is referred to the Commissioner's Report for 1886-87.

COMPARATIVE STATISTICS OF ATTENDANCE UPON COLLEGES AND SCIENTIFIC SCHOOLS
FOR 1875-76 AND 1885-86.

The Commissioner's Report for 1886-87 contained a table showing the ratio of attendance upon colleges and upon colleges and scientific schools in the several States as compared with their populations in 1875-76 and in 1885-86.

A similar table, prepared by Dr. De Bow, in 1857, was republished in the same Report. The latter dealt with white population only; consequently, comparisons made with the later statistics were likely to give a false impression as to the comparative demand for liberal education in the Southern States at the two dates employed in the investigation.

For a correct view of the situation it seemed necessary to supplement the results of the original investigation by a further study of the data from the Southern States pertaining solely to the white population and the collegiate attendance of white students therein.

Since the publication of the former Report this additional study has been made, and the tables are consequently repeated in the present Report, together with the additional material.

The populations have been estimated in this Office, the United States census of 1870 and of 1880 affording the basis. The statistics of attendance have been taken from the Reports of this Office. Students in preparatory courses or departments have not been included.

Considering the institutions involved in the discussion, it will be seen that there was a decrease of 9 in the number of colleges reporting attendance in 1885-86 as compared with the number in 1875-76, and an increase of 10 in the number of scientific schools. The attendance upon the smaller number of colleges in 1885-86 exceeded the attendance in 1875-76 by 7.072, or 27 per cent.; the attendance upon both colleges and scientific schools increased by 8,950, or 28 per cent.; whilst the increase in the estimated population was 11,355,972, or 25 per cent.

In other words, as compared with the increase of population, college attendance showed the slight excess of 1.52 per cent., and attendance upon both colleges and scientific schools an excess equivalent to 2.4 per cent.

CHAPTER XII.

PROFESSIONAL INSTRUCTION.

The efforts made in several institutions to raise the standard of professional training in the United States, the discussions of the subject in professional journals and popular magazines, and its intrinsic importance give particular interest to the columns of the succeeding summary showing for the three classes of professional schools the number and proportion of students who had received a degree in art or science prior to entering upon their professional studies.

Theology leads in this respect, having 23 per cent. of students who had taken degrees, as against 18 per cent. in law schools, 8 per cent. in the regular medical schools, and 9 per cent. in the homœopathic.

The statistics do not indicate to the full extent the advantage which theology has over the other professions in respect to the previous training of its students.

As will be seen by reference to the detailed Table 65, Column 15, the theological schools of several denominations maintain courses from five to seven years in duration. In such cases three or four years are given to a course of study similar in character to that of classical colleges; the student passes from this to the special theological course, receiving a degree only at the end of the latter.

Considering the country by geographical sections, it will be seen that the North Atlantic section surpasses all others in the relative proportion of students in all classes of professional schools holding degrees.

The number of individual States which have a high showing in this respect is small, as will be seen by reference to the summaries, Tables 64, 66, and 63.

The States in which fifty per cent. or more of professional students had taken a college degree are, for theology, Connecticut, Massachusetts, and New Jersey; for law, Alabama and Massachusetts. As regards medical students, no State shows so high a percentage as fifty, considering the students of regular schools only. Massachusetts makes the nearest approach, having forty-five per cent. of graduates in the total of such students.

Considering eclectic schools Illinois has 65 per cent. of graduates in the total number of students.

In previous Reports reference has been made to the proposition of the academic council of Harvard University for the reduction of the college course for bachelors of art who propose to enter the professional schools and the graduate department.

The proposition has been discussed at several meetings of the college faculty, but as yet they have not seen their way to recommend any definite action.

Intimately connected with the question of the previous preparation of professional students is that of the extension and elevation of the professional courses themselves.

The medical schools are at present the subject of the chief efforts in this direction. President Barnard, of Columbia College, reports that the final examinations in the medical school have been very searching the present year, and that arrangements have been made for enforcing equally vigorous entrance examinations in the future. He predicts that whatever may be lost in numbers by this course will be abundantly compensated in the improved character and respectability of the profession.

The auxiliary faculty of medicine in the University of Pennsylvania materially increases the provision for a high order of professional training. This course supplements the customary course of medical lectures by lectures on collateral branches of science essential to the thorough education of the physician. It is essentially a post-graduate course. Matriculates must have entered at least upon the third year of medical study, and the second year in the auxiliary department is taken in connection with the fourth of the regular medical course.

The need of endowment funds for professional schools is emphasized by the history of efforts already made for the improvement of medical education. President Dwight, of Yale University, in his report for 1887, calls attention to the fact that the raising of the standards of the school, an experiment which Yale was one of the first to make, has caused a diminution in attendance.

"The great need of the school at the present time," he says "is an endowment which may furnish it with a sufficient income to supply its wants and to enable its professors, or some of them, to devote their whole time and effort to the work of instruction."

H. P. Bowditch, dean of the medical school of Harvard University, in his report for 1887-88, says:

"The improvement of the course of study has been a subject of grave consideration by the faculty. The establishment of a compulsory four-years' graded course has been formally recognized as desirable as soon as a proper financial basis can be assured. What this basis should be, or in other words, what loss the school would be likely to incur from making the change, is a question about which considerable difference of opinion prevails. A committee charged with the consideration of the subject reported that, in their judgment, a subscription income of \$20,000 a year for five years would justify the establishment of such a course. As it was evidently impossible to obtain a sufficient guaranty fund, the action of the faculty was limited to making certain changes in the course of instruction."

That the condition of professional schools with respect to endowments is far from satisfactory the statistics before us plainly indicate. Theological schools are most favored in this respect, sixty-one or 44 per cent. of the entire number reporting endowments to the total amount of \$11,428,586.

Of law schools only one reports endowment, and of medical schools seven. Of this number one is homœopathic and six regular, two of the latter being schools for women. One dental and one pharmaceutical school also report endowments. It should be borne in mind that professional schools included in a university foundation generally share in the endowment of the same.

The chief particulars of the current record of the professional schools of the United States, as reported from the several States and Territories, are presented in the summaries, Tables 64, 66, and 68.

Considering the country by geographical sections, the totals appear as follows:

CHAPTER XIII.

DEGREES CONFERRED. .

REMARKS ON TABLE 70.

Table 70 presents the classified summary of degrees conferred by colleges and professional schools at the last commencement.

Four per cent. of the whole number were honorary degrees, and of these 97 per cent. were conferred by classical and scientific colleges. Of the degrees in course 45 per cent. are credited to classical and scientific colleges, 6 per cent. to colleges for women, and 49 per cent. to professional schools.

From the classified distribution the relative proportion of the various degrees in course is found to be as follows:

	Per Cent.		Per Cent.		Per Cent.
L. B. or M. E. L.....	2.73	B. M. E. and M. E.....	.70	Art.....	.13
A. B.....	26.	B. Arch.....	.04	D. B.....	2.00
A. M.....	6.	C. and M. E.....	.52	M. D.....	31.06
Sc. B.....	8.60	Mech. E.....	.34	D. D. S.....	3.
Sc. M.....	.75	Ph. B.....	3.14	Ph. G.....	3.39
B. C. E. and C. E.....	1.34	Ph. D.....	.60	L.L. B.....	9.50
B. Agr.....	.01	Mus. B.....	.20	D. V. S.....	.33

Degrees for classical courses represented by A. B. and A. M. form the largest proportion of the whole, viz. 32 per cent. Medical degrees come next, comprising 31 per cent.; degrees in science, including those for general and for special courses, make up 12.3 per cent.

It is worthy of note that 72 per cent. of the degrees conferred by colleges and seminaries for women are A. B. or A. M. degrees. These are indicative either of a classical course or of a course in which French or German has been substituted for Greek.

Of 107 A. M. degrees conferred by colleges or seminaries for women 89 per cent. are reported from the South Atlantic and south central divisions of the country. In these the colleges and seminaries for women for the most part follow the plan of the University of Virginia. They are organized in schools, and confer the degree of A. M. upon those who graduate in all the schools. It can not be pretended that the degree represents the same standards as that conferred by the University of Virginia, but in the colleges for women referred to it appears to be always the sign of a classical course.

CHAPTER XIV.

KINDERGARTENS.

The usual form of tabulating statistics of kindergartens antiquated by their rapid absorption by city school systems—A statistical retrospect at five-year intervals presented in lieu of the customary table, preparatory to its reorganization.—The beginning in 1870—The growth during the first period 1870-75—During the second period 1875-1880—During the third period 1880-85—Attained at the period 1885-88—Why the kindergarten should be a part of the public school system, report of the Boston committee—What, as a public school, it should be, report of the president of the Philadelphia Board of Education—Notes from reports by superintendents of other cities—The growth of the kindergarten fostered by associations—Philanthropy a leading characteristic of such bodies.

The exhaustive fulness of the statistics of kindergarten instruction in the last report of this Office, going so far as to incorporate the lowest classes of institutions for special forms of instruction and requiring the full time of a clerk to make the inquiries and repeated inquiries, has rendered a second full tabulated statement at so short an interval unnecessary.

It is evident that a great change is being made in the character of this class of schools. To use the language of the Philadelphia Society they are becoming the subprimary department of public school systems. Although this tendency has been going on very slowly since the inauguration of a public and experimental kindergarten in the systems of Boston, Cleveland, and St. Louis in 1870 and 1873, the events of the last three or four years have greatly facilitated it.

Now, there are circumstances connected with the public recognition of the usefulness of kindergartens that bear upon the form which the tabulation of their statistics should take. Why should the lowest classes of a system of public schools, because called kindergartens, be isolated and treated as a system of themselves any more than the grammar grade or the intermediate? Or, if such classes are treated separately, because the instruction is sui generis, why should they be intercalated with kindergartens that, being private, have an individuality?

In several instances our forms have been returned with the information that the school having become a part of a public school system, we must apply to its executive officer. And why should the lumped statistics of a system, indeed how may they, be tabulated with those of single schools? Again, kindergarten methods are not confined to kindergarten schools, distinctively known as such; the primary school has "primary school work" which is not the same as the primary school work before the advent of the kindergarten system.

These considerations have induced us to attempt to give the present status of the kindergarten as compared with its condition twenty years ago, and at subsequent intervals of five years; omitting the table, but holding ourselves in readiness to give the statistics of any institution from which we have compiled our summary, on demand. In the meantime the subject of devising proper forms and of making proper distribution will receive our attention.

THE KINDERGARTEN IN 1870.

"The faulty training which too often precedes school work and the imperfections so prevalent in our primary instruction," says our Report for 1870, "have turned the attention of many American teachers to the excellencies of the early training, characteristic of the kindergarten. * * * Neither children nor childhood are sufficiently understood or appreciated. * * * The increasing concentration of our population in cities adds to the necessity of a thorough revision of the earliest work of the school-room throughout the country."¹

In an article by Miss Elizabeth Peabody, of Boston, appearing in the same volume and on the same subject, the practical advantages of the study are thus stated:

"A lady who travelled in Europe to study Froebel's kindergartens brought home from Dresden the whole series of work done by a class of children who began at three years old and continued until seven; and no one has seen it without being convinced that it must have educated the children that did it, not only to an exquisite artistic manipulation, which it is very much harder to attain later, but to habits of attention that would make it a thing of a short time to learn to read, write, and cipher, and enable them to enter into scientific education, and use books with the greatest advantage as early as eight years old. * * * The indispensable preliminary of this new pri-

mary discipline is competent teachers, who can be had only by special training. * * * As yet there is but one kindergarten normal school in America, which is a private one in Boston kept by Mrs. Kriege and her daughters."

Miss Peabody thought the "immediate desideratum to be a free national school to supply kindergarten education to the schools of the District of Columbia, the Territories, and the South, located in the District or, perhaps, in Richmond, Va."

At that time an experimental school had been established at Boston in connection with the public schools and another, though this can hardly be called a part of the system, at Cleveland, the latter under a graduate of Mrs. Kriege's normal school. In California a German lady was maintaining a kindergarten under very adverse circumstances; Dr. Douai had established an institute at Newark, N. J., and Miss Louisa Frankenburg, a pupil and friend of Froebel, was instructing "some superior ladies" in the theory and art of the training at Germantown, a suburb of Philadelphia. The New York school authorities were considering the advisability of making one of three experimental schools a normal school, and "a gentleman," of Springfield, Mass., had established a manufactory of kindergarten material, "a truly public-spirited act," as the outlay would not be returned for years. At St. Louis the subject was receiving great attention, some kindergarten features having been introduced into a primary school.

Such was the condition approximately of kindergarten instruction in 1870. In 1872 W. N. Hailmann, then of Louisville, introduced the following resolution at the meeting of the National Educational Association at Boston:

"Resolved, That a committee of seven be appointed to inquire into the form in which Froebel's principles of education may be most efficiently applied to the educational wants of our country, and to report at our next annual meeting."

The committee was composed of seven—Messrs. Dickinson, Hailmann, Harris, Kraus, Hancock, Baker, and Douai. At the next meeting the committee reported that they recognized in the kindergarten a potent means for elevating primary education and for the development and promulgation of the principles of sound psychology. They recommended that kindergarten institutions, both public and private, be established or their establishment encouraged, and that experiments be initiated to determine the best methods of connecting the kindergarten "with our current educational system." The committee met with four objections: (1) That the training existed only in private and separate institutions; (2) that as the great majority of pupils only spend three years in school, the time should not be wasted in things of less importance than elementary instruction; (3) that as the great majority of teachers are scarcely equal to their present task, it could not be expected they could master "the greater difficulties of kindergarten education;" (4) that two or three years of mere kindergarten instruction would seem to be a mere waste of time to parents wishing their children to learn to read, write, and cipher as rapidly as possible. These objections were dismissed as prejudices.

IN 1875.

The first tabulated statistics published were those which appeared in our Report for 1873, when there were 42 institutions, 73 instructors, and 1,252 pupils. The following summary will show these facts for 1875, not only by States but by groups of States, the period being marked by the introduction of kindergarten training, as an experiment, into the system of St. Louis:

Statistical Exhibit at the close of First Five-Year Period.

Indiana.....	1	1	25	Total for United States.....	95	215	2,809
Illinois.....	5	8	169				
Michigan.....	3	5	89				

Considering the above statistics it is at once evident that the training was sectionalized. Include the District of Columbia and Maryland with the North Atlantic Division, and kindergarten training is confined to that and the North Central Division. Further consideration shows that Massachusetts, New York, New Jersey, Missouri, and the District of Columbia are centres of these centres. It is well known that what Paris is said to be to France, that Washington is to the District; but only five of the schools of Massachusetts are in Boston, only seven of those of New York in the city bearing that name, while the schools of New Jersey are distributed in the towns of the northern part of the State. The Missouri schools are all St. Louis schools. As we are only substituting one form of statistics for another, and not intending to write a history of the rise and progress of the kindergarten in America, we pass to the condition of the training

IN 1880.

Two features mark this period—the spread of the training into the Southern States and its growth as a part of the school system of St. Louis. The exclusion of Washington City and Maryland from the South Atlantic Division now would by no means leave the kindergarten unrepresented in the South, though it must be confessed the number of schools is small; something like the condition of affairs in the West at the 1875 period. In St. Louis the kindergarten had in 1880 grown into a system of the system of public schools; “too much a wheel within a wheel,” says the report for 1881-82 of that city.

Alabama.....	1	1				
Louisiana.....	1	1	23				

We have noted above that a distinguishing feature of the period 1875-80 is the appearance of kindergartens in the Southern States; let us now briefly examine their rapid increase in the North and West.

In the North Atlantic Division the increase was 126 per cent. in schools (that is, for every four schools in 1875 there were nine in 1880, 150 per cent. (two to five) in teachers, and 160 per cent. (five to thirteen) in pupils. The increase occurs in Massachusetts, about half of it in Boston; in New York, more than half of it in New York City; and in Pennsylvania, about half of it in Philadelphia. Two of these cities have suburbs; Boston has Cambridge; Philadelphia, Germantown. These districts have not been included as a part of the city. To have included them would have required us to include Brooklyn, Jersey City, Hoboken, and perhaps even Newark with New York City; and, having got to Newark, why not take in the whole north of New Jersey?

In the West there is an increase of 168 per cent. in schools, of 138 per cent. in teachers, and of 300 per cent. in pupils. Of this extraordinary increase in pupils (3,319), about 65 per cent. occurred in St. Louis, where over a fourth of the schools were situated and over 40 per cent. of the teachers were employed. Outside of Missouri the increase in Ohio, Illinois, and Wisconsin are noticeable. Cincinnati and Cleveland have between them seven of the twelve schools in Ohio, Chicago eleven of the fifteen in Illinois, and Milwaukee six of the twelve in Wisconsin.

On the Pacific Slope the kindergarten seems to have found an uncongenial soil in the more northern town of Walla Walla, but increased with energy in the more peopled city of San Francisco.

We think that with the completion of this period the novitiate of the kindergarten was finished and that a new conception of its value began to be recognized during the period closing

IN 1885.

In 1870, or thereabout, we find the difficulty was to introduce the kindergarten exercises into the usual school curriculum; during 1880-85 it was another problem how to introduce manual training, exclusive of carpentry shop work, into the same curriculum. The later problem seems to have solved the other. "Construction work" is but the "occupations" of the kindergarten in their theory and practice and the occupations are but the continuation of the "gifts" of the kindergarten as we know it—as a school for very young children only.

In considering the condition of kindergarten affairs at this date, we find that when introduced into the South the kindergarten did not increase with the startling rapidity with which it grew in the North and West. Whether the absence of populous cities had anything to do with this we cannot say, and New Orleans will not favor the supposition. The other features are the rapid strides made in California, that is, in San Francisco, and again in St. Louis, where the schools, teachers, and pupils are once again as large as in 1880. What is said of St. Louis is true of Philadelphia, where, emulating the generosity of Mrs. Shaw in Boston, a free kindergarten was opened about 1879 in a public school building and was supported by six persons, each giving \$100. Sometime after, a society was formed, and in 1882 an appropriation of \$5,000 was obtained from the city councils as an experiment. In 1885 the schools, teachers, and pupils had been doubled.

Ohio.....	26	53	641				
Indiana.....	11	32	622				
Illinois.....	37	71	1,715				

In the North Atlantic Division we find an increase of 25 per cent. in schools, of 20 per cent. in teachers, and of 32 per cent. in pupils; in the West an increase of 134 per cent. in schools, of 118 per cent. in teachers, and of 162 per cent. in pupils. Again, it is in Illinois, Ohio, and Wisconsin that the increase is greatest, and still it is in Chicago, Cincinnati (with Columbus and Cleveland), and Milwaukee that the most of the schools of these States are situated.

In the far West, Colorado, New Mexico, Utah, and Oregon appear, not very decidedly however, for the first time.

IN 1887-88.

We have now arrived at the period which, for all practical purposes, may be called the present. After 1855 the tide of favor set strongly for manual training; and manual training, as this Office uses that term, means education, and as education, has its progenitor in Froebel. We shall speak at considerable length on the subject of manual training, what it is, and how it proceeds, and its condition as a department of school work; and we will, therefore, merely say that it appears to us doubtful whether manual training owes more to the kindergarten for theory, or the kindergarten to manual training for success. In brief, a series of inquiries might be instituted: What is manual training as a theory of education without the theory of Froebel? Would the kindergarten have progressed so fast of late had it not been brought into notice by its "occupations" being adopted by manual training? And last, but not least, had manual training been generally understood to mean education and not industrial training, would it have met with such great success?

Two memorable events have recently occurred in the annals of the kindergarten. In 1887 the schools of the Sub-Primary Society of Philadelphia were formally surrendered to the city, and in 1888 the kindergartens established, and until then wholly supported by Mrs. Pauline Shaw, became a part of the Boston system. We wish to present two facts in this connection. For presenting one—the reasons that may be adduced for adopting or establishing classes taught on the kindergarten plan—we will use the report of the Boston Committee on Examination, while for the other—the relation that such classes should bear to the other departments of the system—we will use the report of the president of the Philadelphia board of education.

WHY THE KINDERGARTEN SHOULD BE A PUBLIC SCHOOL.

In May, 1867, Miss Elizabeth Peabody, Mrs. George R. Russell, and Mrs. A. Hemenway, and others petitioned the school board of Boston for a kindergarten; in 1870 an experimental one was established, and in 1879 abolished.

In 1878 Mrs. Pauline Shaw began founding kindergartens in Boston, and continued her munificence until her kindergartens numbered fourteen and the pupils in them eight hundred. In May, 1887, Mrs. Shaw asked the school board to investigate the value of her schools, and the committee to whom the matter was referred requested that \$20,000 be appropriated for public kindergartens during 1888-89. In their report the committee say:

"All that has been involved in making the experiment, all that saves the public from the trials and inevitable drawbacks attending a new educational enterprise, all that personal devotion can contribute to the success of such an enterprise, has been done for us and for the community.

* * * * *

"Such, then, are our opportunities. We have a number of well-established kindergartens offered for our acceptance; and a sister city, in precisely similar circumstances, having accepted the kindergartens originated by private enterprise, sets the example of the same step to be taken here. Is there any reason why we should not take it? Nay, are there not very strong reasons why we should, and make the kindergarten a part of our school system from this time forward.

"Let us be sure that we understand what a kindergarten is. It is sometimes regarded as much the same thing with a day nursery, to which very young children, especially of the poor, may be sent for safe-keeping while their parents are busy with other cares. But as a day nursery is not, and a kindergarten is a place of training, they are evidently not the same. Neither is a kindergarten a primary school, for its instruments and methods are very different; it does not make use of books, or of common school appliances, nor does it claim or desire that discipline or repression to which our primary pupils are generally subjected. The kindergarten is properly a school to train little children as if they really were little children; to train them certainly but not to subdue them, to give them moral and physical training quite as much as intellectual, and so to give it as to make them glad to receive it and able to avail of it.

"The benefits of such a training to the child are self-evident. * * * This preparation for the instruction to follow is the end and the test of kindergarten training. If this training were to unfit a child for the next grade of schools it would deserve the condemnation sometimes passed upon it, and no proposal to adopt it into the system of our public schools could be entertained. But if it really fits a pupil for a primary school and fits him in such wise that he can do better in a primary school than one who has not received the same preparation, then its incorporation into our system would seem to be a measure against which objections would batter in vain. Can we doubt that a course such as has just been briefly described must of necessity render a pupil more responsive to primary training? There are not very many homes, even among the most favored, that can teach their children as the true kindergarten does.

* * * * *

"The incorporation of the kindergarten into our school system is a measure of equipoise. There is a suspicion that the system as it stands is rather top-heavy; * * * to the majority of public school children the more important end [the lower] has remained unextended. Indeed it may be said to have been curtailed, though not by legislation, for it is a singular fact by no means generally understood that the number of the youngest primary pupils has been diminishing for several years. * * *

"One more reason, and a very sound reason, for adopting the kindergarten into our school system is the beneficial effect to be expected from it in the other grades of training. There can be no question that even before its adoption it has had a mellowing influence upon many of our primary schools, softening their discipline and brightening their lessons through and through. If felt there, the influence must continue to be felt in the grammar schools, to which every pupil carries the spirit formed in earlier years."

To thoroughly examine the question from a practical standpoint the city superintendent sent inquiries to about two hundred primary teachers of the lowest primary class of Boston. From these one hundred and forty-eight replies were received, ninety-nine of which were made by teachers who had had the necessary experience to express an opinion. Eighty-six of these replies were favorable and thirteen unfavorable to the kindergarten. The superintendent summarizes the answers under five heads. Want of space compels us to summarize his summaries:

(1) On the intellectual side the training of the kindergarten quickens the powers of observation, gives clear ideas and the power to express them, aids to learn to read, to compute, to draw, and to write.

(2) On the moral side the training inculcates a sense of justice, generosity, politeness, and truthfulness.

(3) The training is better suited to children five years old than the lowest primary class.

(4) On the point of discipline the opinions are by no means unanimous.

(5) As a protectory the kindergarten is much needed.

It is hardly necessary to add the kindergarten is now a part of the Boston system of public schools.

WHAT, AS A PUBLIC SCHOOL, THE KINDERGARTEN SHOULD BE.

The president of the board of education of Philadelphia in 1887 says: "The year just closed will be memorable as marking the introduction of sub-primary schools as a part of our system—twenty-five of which are now in successful operation. The effect of these schools will be nearly to double the opportunity of children for primary education, by adding two years of earlier training. The statistics of school attendance show clearly that a large percentage of children have but a few years to spend at school, and that many never get beyond the primary school, so the sub-primary schools furnish the only practical means of extending the schooling of this class. * * *

"In making these schools part of a system of public education every care should be taken to adjust them to the necessary conditions of this system as a whole. The difference between the organization and management of numerous schools of this kind by a city department and the conduct of single schools by private agency will demand many changes in order to connect them with the general system. Sub-primary divisions should be recognized in our rules just as other grades are, and principles should receive credit for them, in all respects, as they do for other scholars. They should be provided for as a permanent part of our system, and, in the future, the sum required for their support should be included in the gross sum appropriated, and new divisions formed and authorized in the same manner that other grades are established. The preparation of teachers for these schools is a matter of the first consequence, and action should be promptly taken to complete the permanent establishment of a training department for them.¹ Such arrangements should be made as shall prevent any discrimination against the teachers in these schools as to salary. It appears to me that the term 'kindergarten' is objectionable for many reasons, and that it should be discontinued altogether, and the term 'sub-primary' substituted, as describing more fully and clearly the position and function of these schools in our system."

NOTES FROM REPORTS OF CITY SUPERINTENDENTS.

San Francisco, Cal.—So much of the kindergarten work as was considered suitable and of benefit has been provided for in the lower grades of the schools, and the board of education "very properly" provided the means for instructing the teachers of those grades in such portions of the work as has been adopted. Classes composed of the teachers employed in the "receiving" and eighth grades were organized and put in charge of competent teachers, to be instructed in the first four kindergarten gifts, and the course of study was so modified as to include the work in these gifts in the lower grades, and the

¹ See pp. 406 and 446.

work was assigned for the commencement of the term in August. The superintendent says: "If this system of instruction can be made a successful and valuable adjunct to our public schools, it will be only by means of a class of teachers specially and well trained in the nature of it."

Los Angeles, Cal.—The kindergarten work, commenced last year in one school of the first grade, has proved encouraging and satisfactory. It would in all probability be put into all first grade schools but for the lack of rooms and the expense of the materials.

Bristol, Conn.—A kindergarten association has been formed. Twenty-two gentlemen have signed an agreement to support a kindergarten for two years. A graduate of the kindergarten department of the State Normal School has been placed in charge.

Baltimore, Md.—In speaking of this subject the president of the board of school commissioners observes:

"In a previous report we referred with approval to the subject of kindergarten instruction and reiterate the views then expressed. Although this method of instruction has recently been introduced into this country, yet it has rapidly obtained public favor and is now regarded by intelligent educators as a valuable auxiliary to the primary schools.

* * * * *

"In several cities this system has been adopted in connection with the public schools, and under the management of the board of education. It is intended for those children who are too young to enter the public schools, but ought to receive better attention and training than they often receive in their homes. They are too often neglected by parents who are either unable or unwilling to properly train them, and they are left exposed to temptations and acquire bad habits in early life which are difficult to eradicate when they grow older. The teachers who have charge of these schools commend them for their good influence, and claim that they promote the health of the children, quicken the faculties, cultivate habits of neatness, cleanliness, industry, and kindness, and that these refining influences extend through the instrumentality of the children even to their parents.

"An examination of their work and results in our city shows their value, and that their usefulness should be extended beyond the limited means of private schools; and it may therefore be our duty to establish the kindergarten as a branch of the public-school system; and with that view we ask that the necessary authority be given to the board, in its discretion, to establish these schools."

Gloucester, Mass.—We have spoken of Miss Hovey's effort to further new educational ideas under Manual Training, we have now to chronicle another: The kindergarten at Gloucester having been discontinued—it was evidently supported at Miss Hovey's expense—that lady offered to give the town the outfit and to give the school \$300 annually for two years. Financial limitations obliged the authorities regretfully to decline the generous offer.

Ann Arbor, Mich.—While the most of the primary teachers have for some years used kindergarten methods to some extent, a further adoption of the system of instruction seems called for. "Apparently our present opportunity," says the superintendent, "is to bring the methods of our primary grades more fully into harmony with kindergarten forms and spirit." The encouragement afforded by the board of education will enable this to be carried out.

Pateron, N. J.—The kindergarten has become a department of the system of Pateron. To obtain the necessary teachers a lady of experience was induced to instruct a class of young teachers for this work. The instruction thus far given in the schools covers the first four gifts and the "construction" work of the manual training course. Songs and games are also taught.

Trenton, N. J.—"The proper education of children should include not only the imparting of knowledge but also the development of the faculties," says the superintendent. The board became so well convinced of the advantage of the kindergarten over the usual primary school studies that they authorized a trial of it, and the result has been most gratifying. In the opinion of the superintendent thorough kindergarten work should be introduced into several of the school buildings and proper teachers and material provided.

Albany, N. Y.—Three years ago the experiment of establishing a room for the purpose of preparing the youngest pupils for entrance upon the regular grade work by giving them a few months of semi-kindergarten instruction was tried with such success as to cause similar schools to be opened in all the "primaries." The "kindergarten idea" has been extended, in four schools, by furnishing the regular kindergarten furniture and assigning the work to teachers who have made a special study of kindergarten methods.

Rochester, N. Y.—The work inaugurated by the Free Kindergarten Association in 1887 having proved a success, the board of education adopted the training as a part of the public school system. There are now six kindergartens connected with as many public schools.

Portland, Oregon.—The board of education has permitted the Portland Free Kindergarten Association to use a room in one of the school buildings; "as this district draws public school money for those children of four to six years of age who attend the free kindergarten we feel justified in allowing them the use of this room without charge," says the board.

Pawtucket, R. I.—"I desire," says the superintendent, "to offer two or three suggestions in the nature of recommendations. I want to call renewed attention to what is already before the board—the opening of two or more kindergartens in our city. * * * I respectfully and earnestly urge the importance of this improvement."

Providence, R. I.—"Boston has seen the need and use of them [kindergartens], and Providence has followed in the same direction with the approval and coöperation of its careful superintendent," says the superintendent of Pawtucket.

a Not including public schools, of which the number has not been given to us.

b Sixty-six half-day kindergartens.

During 1887-88, or thereabouts, the foregoing figures show great increases over those of the preceding exhibit, though only three years have elapsed. In the North Atlantic Division the increase in schools and teachers has not been very great, but in pupils has been doubled. In Massachusetts the pupils in attendance are three times as many as attended in 1884-85, while in the other States, with two exceptions, the attendance has doubled. In the South Atlantic States south of the Potomac the kindergarten has not thriven, but Maryland, *i. e.*, Baltimore, has made great advance in enrolment, though the number of schools and teachers have not by any means increased so fast. The South Central States of Louisiana (New Orleans) and Texas have made considerable progress. On the Pacific, California (San Francisco) has more than doubled the enrolment, and almost doubled the number of schools and teachers. In the Mississippi Valley it is not the schools that have increased so much as the teachers and pupils in them, the increase of teachers being 30 per cent., of pupils 50 per cent. The increase of teachers has been greatest in Illinois, Missouri, and Ohio; and in the same States together with Wisconsin the increase in pupils has been largest.

It is evident that the figures are becoming too large to show the doubling and trebling results of earlier periods, and that there are more teachers in a school.

RECAPITULATION.

After having made this brief inquiry—too brief, perhaps, for those who would have the perplexing array of if's, and's, and but's inserted, distracting the attention and of no assistance in coming to a conclusion—it may be thought that we should comment on the statistics we have presented. It is said that Charles James Fox deemed an argu-

ment stated in five different ways four new arguments, and we offer the same plea for presenting the foregoing statistics in a new form. If it is not capable of stirring the dullerest imagination into mentally furnishing a text, we are sure that no words of ours would be of service.

KINDERGARTEN ASSOCIATIONS.

When an inventor has patented his device he immediately seeks to form a company with others who have the means to float his invention into public notice; it is getting to be quite the fashion to do the same with educational discoveries, with this difference, however—and a very important one it is—that the educational association is determined to lose money for the public first and last. The dividend is the annual progress made, and the investment is realized on when the “plant” is turned over to the public gratis, as happened in Philadelphia some months ago, when the kindergartens of the Sub-Primary School Society became public property.

It is very true that Mrs. Blow, in St. Louis, and Mrs. Shaw, in Boston, were not societies, but in Philadelphia, San Francisco, Chicago, Indianapolis, and many other cities and towns, we believe, kindergarten work has been established and fostered by associations.

In a number of cases the use of school room has been granted by the school authorities, and the inevitable tendency has been towards the incorporation of this semi-attached school as a part of the regular system. In the case of St. Louis, Philadelphia, San Francisco, Rochester, and Boston, we have seen that this tendency has been consummated.

In examining the motives which actuated the members of these associations we think it is evident that the philanthropic, the charitable, has been more dominant than the strictly educational. We would not be understood as saying that the parents of the children attending the kindergarten were in a less satisfactory condition as to means than the parents of the primary grades, but it would appear that the same idea was not the uppermost in conducting both institutions. The Boston committee, in their report quoted above, further says:

“Of course we are taking for granted that the kindergarten is a strictly educational institution. Time was, and not very long ago, when the education given by it, or by some of the schools called by its name, was of very doubtful value. It may be that this report will be read by some of those to whom the kindergartens they happened to know wore an uncertain aspect. They may be assured that the quality of kindergarten training has greatly improved, particularly during the last few years. All, or almost all, of its abnormal characteristics have disappeared, and it is now pursued with as much common sense, or, we may say, with as much scientific knowledge as any other branch of public instruction. Upon this thoroughly educational character the committee reporting desire to base their appeal for the adoption of the kindergarten by the school board.”

We have now shown how from nothing in 1870 the kindergarten has grown in numbers, and into public favor, until to-day it is becoming, modified in some cases it is true, a part of the public school system. Turning to manual training, the most recent phenomenon in our educational field, a parallel is suggested.

Though in all probability manual training has attained as large a growth as a public school study in five years as the kindergarten has in twenty, nevertheless it has not yet passed through the ordeal of experience and adaptation. To show the present condition of manual training and whence and from what it has sprung is the object of the following chapter.

CHAPTER XV.

MANUAL AND INDUSTRIAL TRAINING.

MANUAL TRAINING: *An exposition, not an argument, attempted—The manual training, the industrial training, and the conservative parties.*

I. AS A PROPAGANDA FOR EDUCATION: *The ideal course—The genesis of the American system—Kindergarten principles and the "Russian System"—Manual training in Sweden, France, England, and Germany—What is meant by manual training as education—Argument of the propagandists—Argument of the conservatives—The arguments compared—Philosophical apparatus and scientific knowledge versus tools and "capacities for useful action"—The special need of manual training for the city boy—Manual training not urged in hostility to the theory of the public schools, but to supply seeming defects of the course with books only.*

II. STUDIES AND CURRICULA: *Drawing—The kindergarten—"Construction," with course in "Hand-Craft" of the Moline (Ill.) schools—Tool instruction, with the course in the "Manual Arts" of New Haven (Conn.) schools; methods and means of Sloyd; the course in a Sloyd school—Sewing, with the course of the Springfield (Mass.) schools—Cooking, with the course of the Washington (D. C.) schools—Modified public school curriculum ("Manual training course of studies") of the experimental New York City schools, in full—The course in the public schools of France.*

III. STATISTICS OF THE COURSE (A) in the Public Schools: *Introduction into the schools of New York City as a tentative—Opinions and discussions of the subject by other educational authorities, from printed reports of city superintendents, special communications, etc.—Associations—Table: Showing number of instructors and the pupils in the several branches of manual training—Table: Number and duration of lessons a week for manual training classes—Table: Cost of introducing and maintaining manual training—Abstract of the statistics, by cities, as returned by superintendents with their remarks, etc.—(B) In Manual Training (High) Schools, Public and Private: *The Imperial Technical School of Moscow—The special professional schools (Gewerbliche Fachschulen) of Germany—French apprentice schools—American manual training schools—Their character as given by their directors—Table: Officers and connection with other institutions—Table: controlling bodies and methods of appointing them—Table: Admission requirements, fees, and length of course—Table: Literary and manual courses of study—Table: Number of instructors and pupils—Table: Finances and property values.**

INDUSTRIAL TRAINING: *Difference of purpose between those urging manual work as a means of education and those who would foster industry—Both parties hope to remove prejudice against laboring with the hands—The socialistic feature of the Paris schools—"Practical party's" view—Distinction between manual labor as manual training, and as industrial training defended, for the present, on difference of aim.*

I. INDUSTRIAL DEPARTMENTS OF SCHOOLS FOR THE SPECIAL CLASSES: *The workshop coeval with the foundation of these schools—Introduced from Europe—Instruction in schools for the deaf, statistics, and remarks—In schools for the blind, statistics, and remarks—In schools for the feeble-minded, statistics, and remarks—In reform schools, statistics, and remarks—In "Industrial schools" and statistics—[For industrial instruction in schools for the colored race, see Chapter XVII.]*

II. TRADE SCHOOLS: *The Williamson, Rindge, and the Pratt Schools—The New York Trade Schools—The Nautical School of New York City.*

MANUAL TRAINING.

In treating of the subject of manual training it is a matter of some degree of delicacy to avoid giving offence either to those who are carrying on the great propaganda or to others who oppose their views; while, if an attempt is made to be non-partisan, a still more unfortunate result may follow, inasmuch as the displeasure of both may ensue.

The witty remark of Sydney Smith, that the great object of a review article is to make men wise in ten pages who have no appetite for a hundred, is not in point here. We have no wisdom to dispense, much less a *theory* to support. To see adopted as a means of awakening thought operations which have for centuries been looked upon as mechanical, using the word in its figurative sense, to hear on one hand a demand for manual labor because the youth who go from the schools are educated against it, and on the other a demand that it shall be introduced because 90 per cent. of these follow a manual occupation, to hear on one side a demand made for manual training as a branch of education and on the other as a branch of industry, and to find the whole subject obscured by a cloud of words, are of themselves quite sufficient to prevent any exertions on our part, either in the field of novelty or paradox.

If, then, this Office can put before the public in a succinct and intelligible manner its statistics and other information, which it finds meager and unsatisfactory, as the State superintendent of New Jersey did that he could get; if it can place in the hands of the reader a body of facts that will enable him to have an intelligent idea of the conflict waged by conservatism against the metaphysics of education by manual labor at one point

and watered communism at an other, it will be abundantly satisfied to leave brilliancy, depth, and originality to the many competent hands who have been and are now developing or opposing the subject.

On one side of this important question are ranged those who, maintaining that the present system of education gives entirely too much weight to the cultivation of certain faculties with which man is born and neglects the development of others more important to the practical affairs of daily life, while on the other are those who, content with the ground plan of our present school system, deny the so-called necessity for this extension of the pale of the public schools, demanding rather that every energy be used in improving the powerful engine of civilization that has gradually grown up among us—one of our most important social if not political institutions they would say, which should not be hampered by engrafting a business course upon it, the function of the public schools not being to produce mechanics. The members of the party of agitation seem to be divided among themselves, though working harmoniously to attain their common object; one party contending for manual training as education, the other considering it in a commercial point of view.

Not only in the educational but in the public press, in every educational meeting whether for discussion or for business, no topic is more common than the subject of introducing manual training into the public schools. While theory has been busy in finding arguments for and conservatism against the introduction of the new department of study, bold spirits have not hesitated to put their views to a test; but experience has not yet had time to give judgment.

It is hoped, therefore, that the pages that are devoted to this subject will be looked upon—and we say it again for the emphasis—as an endeavor to place it on a basis of fact, and not another effort to find reasons for or against it, which have escaped the attention of those whose mastery of the question entitle them to speak.

I.—MANUAL TRAINING AS A PROPAGANDA.

THE MANUAL TRAINING COURSE.

The ideal course of manual training is said to begin in the kindergarten and close with graduation from the manual training (high) school. This ideal we believe has not yet been practiced by any system, though several only lack the kindergarten or one other feature to realize it. At St. Louis, Philadelphia, and Boston, kindergartens are a part of the public school system of the several cities, and it is not improbable that in a comparatively near future all children too young for books will be taught by Froebel's development of Pestalozzian methods. As the child grows older, new tangible work must be provided in course, and the gifts of the kindergarten are to be supplanted in this ideal by "construction work" in clay, card-board, and paper, as now transpires in New York and Washington, D. C. In the upper grammar grade, however, tool work is introduced for the boys, and sewing and cooking for the girls, the first and last subjects requiring the pupils to leave their room, almost always their building. In the manual training school, which is the crown of this pleasing structure, the male pupil having now attained to sufficient strength, is brought face to face with the two great materials of construction, wood and iron, and is made familiar with the construction of that important feature of our age, the steam-engine.

All this is but the tangible work of the instruction; hand in hand with it moves drawing, from slate work and the punching processes of the kindergarten through lines straight and curved, and their final combinations into artistic forms in the intermediate and grammar grades, the study terminating at length in the manual training school with instrumental drawing and shading.

As an artist is said to obtain the material for a picture from many different places, so is this ideal curriculum as whole but the composition of several realities, no system having yet adopted it in full. As the term manual training will be very frequently used in what follows, it is hoped that its meaning will be recognized as covering anything that occurs in the foregoing description that is taught as a means of intellectual development; and that the term industrial training does not mean manual training but another kind of training altogether, such as is given, for instance, at the admirable Trade Schools of New York City, or in schools for the deaf and other special schools.

THE ELEMENTS WITH WHICH THE AMERICAN SYSTEM HAS BEEN FORMED.

The first section of a remarkable body of doctrine, entitled the Theory of Education in the United States, relates that the American school system is an organic growth, meaning, of course, not that growth of feeling of the necessity of the thing which continued appreciation and time engender among a people grown accustomed to civilized life and its conveniences, but an orderly and consistent progress from crude simplicity to full de-

velopment. The manual training course is not such a growth, nor has it sprung into the world, like the goddess in the fable, full grown.

This is not the place to recall the events of twenty years ago that resulted in the introduction into the schools of Massachusetts and other systems of the Union of what is called industrial drawing. The history of that event has been most elaborately dealt with by this Office.¹ Suffice it to say that, Massachusetts having great manufacturing interests centered in large towns, it was but a natural business instinct that a body of highly respected citizens connected with great industries should petition the legislature to devise some plan for "introducing schools for drawing or instruction in drawing free to all men, women, and children in all towns of the Commonwealth of more than 5,000 inhabitants." The report of the State board of education, to whom the matter was referred, says:

"Agents could be employed to go through the Commonwealth and interest the people in this most important subject. Wherever evening classes can be formed of the young and old, free instruction should be furnished in free-hand drawing, and in a few years our enterprising people will begin to discover in our own communities and schools as good artists and artisans as can be found in the most favored portions of other countries."

It appears that the introduction of drawing was a matter of political rather than of educational economy, of material prosperity rather than of intellectual development.

The kindergarten, already in the public schools of France, the place of beginning for manual training, was hardly intended by its American advocates to be an introductory course to the Russian system, but had far higher claims as a rational method of human development adapted to the extremely young; in fact, as a, if not as the, proper way to prepare a child for book work.

To a disinterested reader of the remarks of Mr. Della Vos, of the Moscow school, it does not appear from his language² that he finds himself or those he represents on having given a new development of Pestalozzian methods, but rather it will appear that he takes pride in having analyzed industrial processes, seized the essentials, tested and proved them; of having introduced "a systematical method of teaching the *arts* of turning, carpentering, fitting, and forging."

Of the introduction of tool work into the Boston schools we speak with some diffidence. About 1882 Prof. John M. Ordway, now in charge of the Manual Training Department of Tulane University, made a report on the Swedish system of manual training, called, by those who can intelligently use the word, *Slöjd*.³ A committee of the State board of education, after dwelling on the great similarity of Swedish and American manners and institutions, advocated the introduction of the Swedish system as the only one that "embraces the elements of manual training that aims, precisely as we aim, at manual training rather than industrial education proper." The instruction given in the Dwight school, the committee says, was illustrating that work of this kind could be done.

As to the purpose of construction work, the last of the several features of manual training to appear, there can be no doubt that it was introduced in a purely pedagogical spirit. It has been advocated on such grounds for years by Dr. Felix Adler, of New York, and exemplified by his Workingman's School, a continuation of the Free Kindergarten School; and the gap between the kindergarten and the manual training school (Russian plan) signaled by the New York committee's report on manual training, is being supplied by the adoption of processes somewhat similar to those of the lower grades of this "Workingman's School."

The kindergarten, then, and its extension, construction, are without doubt based on a pedagogical theory pure and simple, and not on the bread and butter argument. Drawing was introduced to foster industry, for "Drawing is the language of mechanics, and ability to use the pencil lies at the foundation of success in many mechanical pursuits." Prof. Della Vos's school is a preparatory institution to the foundry and machinery shop; while the tool work at the Boston grammar school was an isolated fact; no note is made of a preparatory course in construction work and in the kindergarten,⁴ no future in a school on the Russian system.

¹ Art and Industry. Education in the Industrial and Fine Arts in the United States, by Isaac Edwards Clarke, A. M. Part I. Drawing in the Public Schools. Other parts issuing. The title of this comprehensive work reflecting as it does the language of the original resolution by which it was called forth, evinces the ground lines upon which it has been or is being written or compiled by the gentleman who is carrying the work forward. It will be seen that in treating the subject we have spoken, from the educationist's view, as becomes us; our object being to elucidate, so far as in us lies, the value of manual training to our public schools and not the value of industrial training to our industries.

² P. 829.

³ Hereafter this word will be spelled as it is pronounced, *Sloyd*; the unlauded vowel and j having the sound of y, being utterly foreign.

⁴ See page 839. It will be there observed that kindergarten instruction is not industrial or manual instruction, but "another kind." Let it be noted, however, that the above is a report to the board by a committee, and that on page 839 is the report of the State board.

Our distinguishing and peculiar characteristic, if we are to believe foreign critics, is the power we have as a people of adapting existing conditions to our advancement. In no other instance would this power of utilization be exemplified better than in this, were manual training to become universally a part of the public school course. Gradually but surely there appears to be organizing out of the elements never or only slightly attached to the public school curriculum a course of study, too thorough and comprehensive to be called either Russian or Swedish, that may well be styled American.

THE KINDERGARTEN AND THE "RUSSIAN SYSTEM."

In its late report on manual training the committee of the New York Board of Education says that it appears "that the department of education now generally known as manual training was introduced into this country by certain broad-minded practical educators, to whom its educational possibilities presented themselves as its chief claim for adoption;" and further, speaking of manual training and the kindergarten, "Although of widely different origin and purpose, its [the kindergarten's] close pedagogical relations to manual training, and the identity of their fundamental principles, become upon investigation at once apparent."

Now if these two "new and fresh conceptions of true education," as the committee calls them, are identical in "their fundamental principles," they are merely the same thing disguised under different names, and as one of them is "of widely" different "purpose" from the other, each must have, at least may have, two purposes, one conception presumably having been originated to serve one purpose and the other the other. What these purposes are the committee unfortunately do not tell us; and yet it is important to know, so that we may understand for which purpose these fundamental principles are being urged for our rational assent.

A disciple of Froebel might beg to differ with the committee. When the manual training principles are pedagogical he might think with great propriety that they are not in *relation* with kindergarten principles, but *are* kindergarten principles. "Experience and history, too, teach," says Froebel¹, "that men truly and effectively promote human welfare much more by what they put forth from themselves than by what they may have acquired. Every one knows that those who truly teach gain steadily in knowledge and insight; similarly every one knows—for nature herself teaches this—that the use of a force enhances and intensifies the force. Again, to learn a thing in life and through doing is much more developing, cultivating, and strengthening than to learn it merely through the verbal communication of ideas. Similarly plastic material representation in life and through doing, united with thought and speech, is by far more developing and cultivating than the merely verbal representation of ideas"; and, after a few lines, he continues, "For the purpose of teaching and instruction is to bring ever more out of a man rather than to put more and more into him."²

We are aware that philosophers, like those who would patent a device, endeavor to cover as much as possible; but that this is a fundamental—yes, the fundamental doctrine of Froebel—is distinctly claimed by his great disciple, the St. Paul of his system, the Baroness von Marenholtz-Bülow.³ "Pestalozzi, like Froebel," says this lady, "insists that there should be no such thing as instructing children without giving them corresponding sense-impressions and without affording them opportunities of observation and demonstration; in short, no mere word-teaching. Here, however, Pestalozzi stops short of Froebel, who insists still further that children should learn by means of original productiveness. Exercise of the limbs and organs merely as such does not satisfy Froebel, who demands from the very first some result of this childish activity, and moreover a kind of activity which is never purely mechanical, but which exercises the mental powers at the same time as the bodily ones."

But it is perfectly possible to agree with the committee when it says that "manual training," "industrial training," "the use and abuse of tools," as the term was understood or misunderstood before the committee in its valuable report taught us to use

¹ Education of Man (Die Menschenerziehung), translated and annotated by W. N. Hailmann, A. M., p. 278.

² Mr. Herbert Spencer in his epoch making book on education, places the idea in another light; he says: "We are none of us content with unfolding our own individualities to the full in all directions, but have a restless craving to impress our own individualities upon others, and in some way subordinate them. And this it is which determines the character of our education."

We have not attempted to note the influence which Mr. Spencer's celebrated book has had in bringing forward the manual training idea, the connection between the ideas of the writer of the book and the advocates of the new education being indicated by the common use of the expression "preparation for complete living." Such an attempt we feared would add rather to the completeness of our article than to whatever interest or novelty it may have. On page 443, however, under the proceedings of the Ohio teachers' association, there are some remarks on the subject by Supt. Ellis which should be consulted.

³ Hand-work and Head-work (Die Arbeit und die neue Erziehung nach Fröbel's Methode), p. 9, English edition, translated by Alice M. Christie.

the word properly, had a different purpose, at least in its origin. Let Director Della Vos, of the Moscow school, speak for himself:

"In 1868 the school council considered it indispensable, in order to secure the symmetrical teaching of elementary practical work, as well as for the more convenient supervision of the pupils while practically employed, to *separate entirely the school workshops from the mechanical works*,¹ * * * admitting pupils to the latter only when they have perfectly acquired the principles of practical labor."

But this mere separation was not sufficient to accomplish the principal aim. "It was found necessary to work out * * * a *method of teaching the elementary principles of mechanical art*. Everybody is well aware that the successful study of any art whatever, freehand or linear drawing, music, singing, painting, etc., is only attainable when the first attempts at any of them are strictly subject to the laws of gradation and successiveness, when every student adheres to a definite method or school, surmounting little by little and by certain degrees the difficulties to be encountered. All those arts which we have just named possess a method of study which has been well worked out and defined, because, since they have long constituted a part of the education of the well-instructed classes of people, they could not but become subject to scientific analysis, could not but become the objects of investigation, with a view of defining those conditions which might render the study of them as easy and regulated as possible. If we except the attempts made in France in the year 1867 * * * to form a collection of models for the practical study of the principal methods of forging and welding iron and steel as well as the chief parts of joiners' work, and this with a purely demonstrative aim, no one, as far as we are aware, has hitherto been actively engaged in the working out of this question in its application to the study of hand labor in workshops. To the Imperial Technical School belongs the initiative in the introduction of a systematical method of *teaching the arts of turning, carpentering, fitting, and forging*."

The widely different purpose is clearly shown here. It is a method of teaching the arts that are said to be the foundation of all mechanical pursuits, not the method of developing what, as Froebel says, is in the child as an undeveloped individual and is not yet the property of the world.²

As to the pedagogic value of this remarkable doctrine of Froebel, that is a matter with which we have nothing to do. Year by year the kindergarten is bettering its condition. For those advocating manual training on pedagogical grounds it would be suicidal to deny the Froebelian doctrine; and the political economy and conservative parties are only at issue with the followers of its author in asserting that he was mistaken or dreaming. The arguments advanced by the contending parties will be given hereafter in an attempt to fix what one side, the innovating, means by manual training, and the other thinks the innovators mean. At present we will turn to

MANUAL TRAINING IN EUROPE.

Manual work was introduced into the schools of Sweden in 1872 under the name of Sloyd (meaning, it is said, manual dexterity), and in 1882, under the name of l'enseignement du travail manuel, into the schools of France. In Sweden the work is given to volunteers, meritorious scholars, out of school hours; in France it is compulsory on all. In Sweden the subject appears to be in the same condition as with us. In France, the study having been determined upon as beneficial and consequently introduced, is being carried out; the minister of public instruction having, in a circular of 1885, made pub-

¹ The Office has taken the liberty of italicising in this and in several other instances words not so distinguished in the original.

² Some weeks after this chapter had been written we received the reports of the special committees on manual training and educational statistics of New Jersey, in which Mr. Butler, president of the New York Industrial Education Association, expresses views that are very similar to those expressed here. "The principle underlying the kindergarten," he says, "and the manual training school is *one and the same*." And again, after speaking of the early acceptance of the term manual training which meant "exercises in the use of tools employed in working wood and iron," he says that when the St. Louis School and afterward the Chicago School were founded the connotation of the term was broadened to include drawing.

But we will particularly ask the reader's attention to the following language, since to convey the thought put forth in it gave us more concern than all else, "when the principle of the manual training school was attacked and criticised and it became necessary to show on what grounds it could appeal to the public funds for support it immediately became necessary to examine very critically not alone the economic arguments which were urged in its favor, but the educational ends which it was expected to serve. It was at once claimed by its advocates that the manual training school was not a trade school nor a school for apprentices, but an educational institution." So frank an admission from such an authority would have forestalled the preparation of much of this chapter, would have enabled us to assume things that we thought ourselves compelled to show. It is with pleasure that we find our conclusions in unison with the authority from which we have quoted not only here but in other parts of this chapter.

Had manual training been introduced as mind training in the first place it is doubtful if it would now be understood to be trade training, and the change of front, an after-thought on the part of its intelligent advocates when challenged, is, no doubt, and will continue to be viewed with suspicion by many until experiment has proved such suspicions unfounded.

lic complaint that the law of 1862 ordaining the work was far from being completely and generally executed.

IN FRANCE.

In the remarks introducing the programme of manual studies to be followed and the manner of teaching them, the French minister of public instruction observes:¹ "In determining that this instruction shall hereafter be a part of public instruction, the legislator has desired to have it understood above all that work, being at once the support of morality and the source of national prosperity, ought in a *democratic republic* to be not only rehabilitated but brought into honor.

"In addition, the legislator has prescribed that this instruction shall commence with primary school, recognizing that the love of work can only come through the habit of working, and that, reciprocally, the habit of work can only come by implanting the love for it. In short, from this early acquired taste should be engendered a precocious ability, an indispensable condition for future excellence and consequently a condition of economic success in foreign markets.

"It is to the teacher that the task of forming the generations which are to verify these views, not less social than patriotic, is confided; he, then, ought to be responsible to the country, and he will be placed in the rank that he merits according as he attains to the height of his mission or fails therein."

IN SWEDEN.

It has been remarked above that the Boston committee on manual training dwelt upon the resemblance of Swedish and American life and thought. The following would show the propaganda of manual training to be a case in point:

"As a whole," says Director Salomon, of the Nääs Normal School for Sloyd Instructors,² "this agitation for Sloyd instruction is divided into two different movements, which, although confused by superficial observers, in reality have nothing in common except the name. The one is of purely national-economical significance, in that it is based upon the fact that domestic industry is decreasing more and more, and sets itself the task of taking measures to teach the rural population, especially fitting Sloyd labors for home occupation, whose products may be applied either in the house itself, or may serve directly for sale. This Sloyd movement sees in the school the means for extending Sloyd skill. The universal and real claim of the school to be an educational institution for the training of its pupils must, in accordance with this movement, retire into the background before the design to give to the pupil the requisite skill to prepare certain objects destined either for sale or for domestic use. In the choice of such labors, then, the decision must be made from points of view quite other than pedagogical. It can neither be taken into consideration, nor should it be, whether the kind of labor or the method of instruction employed is of a character to influence profitably the education of the child. The objects produced become the essential part; the worker himself, on the other hand, is an incidental part. The support of domestic industry is the solution of the problem, and the most powerful factor thereto—the school—is withdrawn from its actual, definite task, and compelled to serve purposes foreign to it.

"It is wholly different with the other movement that desires to place the Sloyd in the service of the school. Manual labor arranged on pedagogical principles is, in many respects, an extremely efficient means for the education of children. It desires, therefore, to introduce the Sloyd into the school, not for the furtherance of the Sloyd, but because it believes that the school by means of this branch of study will exert an influence, in a manner more perfect and as many-sided as is possible, upon the development of its pupils. Not the products of labor, but the laborers themselves are, according to this idea, the most important part. Whether the objects produced during instruction have a higher or lower market value; whether the children shall in the future perform the same labors or not; whether the kinds of Sloyd with which the pupil is occupied in school are the best fitted for trade and home occupation—all these and other points of view are but incidental. They are as little to be taken into consideration in the arrangement of instruction as though, for instance, in the adoption of a school book its practicableness after the completion of school should be considered; or as if the blackboards, ruled writing books, and copies should be removed from the school room because the children must in the future get along without their aid. The kinds of Sloyd and their methodical arrangement are here only means and must be so regarded. They have, so far as the school is concerned, in themselves no other right save in the measure they are fitted to perform,

¹Instruction spéciale sur l'enseignement du travail manuel dans les écoles normales d'instituteurs et les écoles primaires, élémentaires et supérieures. Mémoires et documents scolaires. Musée Pédagogique, Fas. 8.

²The Sloyd in the Service of the School, translated by William H. Carpenter, PH. D. Monograph of the Industrial Association, New York City.

the especial educational purposes to the attainment of which the school applies them; and the educational value that they have is the only standard by which to judge them.

"A not unimportant part of the opposition which—perhaps less in Sweden than in other countries—has arisen against the introduction of the Sloyd into the school is, without a doubt, based upon a very explicable confusion of these two movements, so different in means and purpose, on the part of such teachers as stand aloof from the movement. Many a teacher, perfectly well cognizant of the difficulties met with in carrying out, even approximately, the many and weighty requirements that are the specific task of the school, perhaps mistakenly believes that Sloyd instruction will necessarily decrease the efficiency of the school and will turn it aside into directions foreign to its educational aims. It is not strange that he will not give his coöperation if he, with all respect for the advantages of domestic industry, still doubts whether it is right to lead the school away from its own high purpose on to foreign ground, however worthy of attention the same may be. The opposition, or at least the impassiveness towards the question of Sloyd instruction, in which teachers often persist, is based accordingly to no slight degree upon a false conception of its real meaning."

IN ENGLAND.

In England Sloyd is attracting great attention. On the 21st of June, 1888, a "Sloyd Association" was organized at the residence of the Earl of Meath, in London, that nobleman acting as president. The objects of the association are: (1) to make Sloyd known to educators and the public generally, and to unite all those who are interested in its promotion; (2) to found a Sloyd training institute for teachers, which shall also serve as a centre where information on Sloyd work and principles can be obtained, and become the headquarters for branches throughout the country; (3) to endeavor to make Sloyd *national* in character by adapting the practical work to English habits and requirements, while adhering to its principles, which are equally true for all countries; (4) to establish a Sloyd register in which shall be entered the names of the teachers and schools whose Sloyd work has been inspected and approved by the association.

Commenting on this movement the able journal from which the information has been taken,¹ after enumerating a number of influential persons in political and educational life who have become officers, observes: "An association so able officered only requires to be well supported by the public to be a brilliant success. It is earnestly hoped that teachers of all grades will join its ranks and give it their hearty support. In order to bring the subscription within the means of all, it has been decided that the minimum annual subscription for *teachers* shall be 2s. 6d."

The late Education Commission, in its report, handles the subject of manual training quite conservatively; it says: "If it should be thought that children ought to receive some instruction in manual employment other than that which the elementary schools available for their use can give, we are of opinion that the best way of meeting the need would be through the establishment of a workshop in connection with some higher institution, which might be willing to receive into the workshop boys of exceptional ability, or others to whom it was considered desirable to give this instruction. One such central institution could do its work cheaper and better than a number of scattered institutions, whilst nothing could be easier than to make arrangements for attendance at this central workshop being substituted on one or two afternoons in the week for attendance at the elementary school."

IN GERMANY.

The Office has no information of the progress of manual training (*Erziehliche Knaben-Handarbeit*) in Germany other than a résumé of the proceedings of the 8th German Congress of educators interested in the subject, held during September 22nd and 23rd, 1888. An abstract of the remarks of two speakers will be given; one presenting the educational, the other the economic side of the question.

Professor Götze, of Leipzig, in speaking of "Industrial Instruction (*Arbeitsunterricht*) in the Service of general Education," remarked that "industrial instruction was not given with a view to teaching a trade, but to help the child in a general way to a harmonious education by means of practical work. Such instruction assisted the physical development of the child; taught him to use his hands deftly and to exercise his mind. It assisted the mental life of the child to develop while supplying him with objects for contemplation, taught him to observe, and afforded him an opportunity for personal experience. It, therefore, assisted the mind in its æsthetic education by showing what is beautiful in form, developing taste, assisting also in overcoming physically difficult but necessary tasks, and finally exerting an influence in the formation of a steady and energetic will.

¹Journal of Education, London, No. 230.

The economic or business view was presented by Herr von Schenckendorff, of Görtz, who said that during the last fifty years many important changes have taken place in the life of the people and their culture is upon a new basis of development. All culture is accomplished through human labor. Public education must give to the next generation the elements of the knowledge and power already won from the sphere of work, if that knowledge and ability is to be continuously added to. Public education, it is true, gives a general preparation for manual labor by forming the intelligence; but it has as yet hit upon no plan by which an interest is evoked for the calling of a mechanic, or strength or aptitude for it developed, and yet in such work more than nine-tenths of our people are engaged. Is it astonishing, then, if to-day so little inclination exists for the mechanic trades? The child has learned to use his hand in writing and to draw a little, but not for catching hold, not for living forms, not for producing. The eye has been taught, indeed, to see the letters of the alphabet, but the view is not opened for the things of the world. To-day the child leaving the school starts in life with almost a dread of manual work. Thus it follows that at present in the entire circuit of the schools there is an unhealthy shifting of the forces in the direction of social accomplishments which must create the danger of an educated proletariat. Manual labor is looked upon as degrading, and yet by it alone is man able to support himself. Thus is originated a conflict between inclination and necessity, nourishing social discontent. We must learn to value work more according to the industry, the conscientiousness, and perseverance with which it is performed. On these general grounds, therefore, the manual labor school by the side of the literary school (*Lernschule*) is a necessity for our present education.

MANUAL TRAINING AS EDUCATION.

In the foregoing the present condition of manual training as a propaganda has been briefly stated, and the manual training curriculum defined. We have found the new department of study to be, as an ideal at least, a connected series of instructions from the earliest days of school life until the age, comparatively, of discretion has been reached, but that it has not been a growth in the proper sense of the word but rather an adaptation of several elements, introduced as isolated subjects of instruction and not always as educational, to supply inherent defects, so claimed, of our present system of elementary education. We have examined the condition of the subject in foreign lands and have found that only in France has it been thoroughly introduced, whether for purely pedagogical reasons, it is difficult to say; that in Sweden parties are advocating and defending it on lines that wonderfully resemble those drawn here; that England is canvassing the subject, and Germany holding congresses. Possessed of these facts the reader can follow the conflict of the theories of the contending parties at home, as we endeavor to find the cause of contention.

THE MANUAL TRAINING ARGUMENT.

The first argument is that advanced by the great Industrial Association of New York City: its elegant simplicity of style and statement can not but commend it.¹

"The argument for manual training rests upon psychology, and it is only modern psychology that has discovered and emphasized the place that man's powers of expression occupy in the acquisition of knowledge and the development of mental capacity. Manual training is the form of instruction with which it is proposed to appeal to these powers of expression. It consists of two reciprocal parts, drawing and constructive work. The object of the training is to add to the pupil's power of expression by verbal description, the powers of expression by delineation and by construction. Either of the latter powers is simpler and easier than the use of abstract language. It is more natural to be able to draw a sphere, or to make one out of clay or wood, than to comprehend the geometrical definition of a sphere. Yet the curriculum of the ordinary common school has no place for the former, while it devotes much time to the latter mode of expression. It will be seen that the argument thus outlined is a purely psychological or educational one, and takes no account of the social and economic benefits that are known to result from manual training. Though these benefits are great, it is obviously out of place to urge them as other than addenda to the main argument. Many persons lay the greatest stress on the social and economic benefits referred to, and thus confuse the argument for technical education with the argument for manual training in the public schools. 'Industrial education' is the title used to signify the education which includes manual training, but it is also often used as synonymous with technical education. The failure to discriminate between these two significations of the phrase 'industrial education' has caused much confusion, and almost all of the arguments that are advanced against manual training are traceable to a misconception of what manual training really means. Even those teachers and others who advocate manual training are not always clear as to

¹The Argument for Manual Training. Educational Leaflet No. 1, Nov., 1887.

what it means. They often speak of substituting manual training for mental work. This is incorrect. The substitution is of one form of mental work for another. Manual training, in the sense in which it is here used, is mental training. It is a training of the mind to accuracy of perception and truthfulness and readiness of expression. If manual training were non-mental and non-disciplinary it could have no proper place in the public-school course. The schools are not established for the purpose of teaching pupils how to make a living, but to teach them how to live. They are not to teach trades, but to educate.

"The argument for manual training asserts that the power to express and use knowledge is an essential part of the process of acquiring knowledge. It claims that in the past the powers of expression have been neglected in education, and that the appeal made to them in the instruction in reading and writing is not sufficient. It points out, too, that nowhere in the present school course is any provision made for training the judgment and executive faculty, than which no mental powers are of more practical importance. The instruction in delineation and construction, which is included in manual training, appeals directly to both these faculties.

"It will now be seen, it is hoped, that the argument for manual training in the common schools is psychological and educational. It is not economic or utilitarian."

THE CONSERVATIVE ARGUMENT.

In one of the leading educational journals¹ of this country one of the most distinguished educational authorities has expressed views in opposition to the introduction of manual training in the public schools that have attracted considerable notice. As each argument appears unanswerable when considered separately, we will take the liberty of comparing them and endeavor to find wherein they are not in unison. Dr. Dickinson says:

"Suppose, then, it is admitted by those best able to judge, that the proper function of the public school is to furnish the occasions of symmetrical human development, it still remains to determine what are the occasions of this development.

"Human development is produced by the right exercise of power. In school the occasions of this exercise are objects and subjects of thought. These, collected and rightly arranged, constitute our public school courses of study.

"If, therefore, the courses of study used in the public schools are defective, the mental development produced by pursuing these courses will be defective also. In criticising the school, then, we must first turn our attention to defects in the products, and second to the defects in our school exercises that have occasioned the defective products. In criticising results it is said that the children pass out of their classes in school into active life without being prepared for anything. They may have some information, but they seem to have very little actual knowledge. They may be able to understand what is explained to them, but they have neither the ability nor the inclination to produce anything by their own independent activity. They may have some power of thinking, but they cannot realize their thoughts in any product outside their own minds. Their capacities have been trained, but their faculties have been neglected.

"These statements are made by those who, dwelling upon the products of their imaginations, neglect to observe for facts. Nevertheless the criticism has some foundation and directs our attention especially to one defect charged against the schools. This defect consists in a failure to train the children to an independent use of their powers. It is proposed to supply the deficiency by introducing into the school exercises a training in the use of mechanical tools. This is to be done not for the sake of the manual dexterity that may result, but for the general development of active power that may be produced. For no other reason than this can the practice with mechanical tools find a legitimate place in the public schools.

"Admitting that the defects in our present school work actually exist, it does not follow that they are due to defective courses of study nor that they may be removed by adding the operations of the workshop to the list. Both these things are assumed, but neither of them has yet been proved to be true.

"Mere manual dexterity acquired without reference to invention or construction is the product of imitation. To produce it requires a simple practice in imitating a few mechanical motions made as examples to be imitated. After a sufficient number of repetitions the states of mind which are the causes of the movements of the body are hardly the objects of consciousness at all, and the individual moves on under the influence of the mechanical principle of action. Great manual skill is often found with those whose general intelligence is of a low order. If this is true, it follows there is no necessary connection between the two.

¹ Education, June, 1887.

"By long-continued imitation men seem to become very much like the machines they use. In our experiences I am sure we have all found instances of this kind. Such persons become skilled in imitating, but at the same time they may be wanting in independent and progressive power. They may be wanting in that general intelligence which is necessary for the regulation of their private conduct as individuals or of their public acts as members of a self-governed state.

* * * * *

"It does not appear that mechanical dexterity holds any necessary relation to general intelligence or to virtue.

"To cultivate it in the schools must distract the mind from its legitimate disciplinary work and lead it to pursue other and inferior ends. The president of a western industrial institution recently read a paper before a convention of public school teachers which contains the following statement: 'I have not been able to discern such valuable results from hand culture as my friends seem to find. I do not find that the exact construction of a box leads to the exact construction of an English sentence. But mechanical students need as much drill as any others. I have not found that students in mechanical courses are specially good in their mathematical work. On the contrary, I do find that the best workers in wood and metal are they who have clear thoughts and can express them clearly, and who have mathematical ability.'"

If it be considered that the advocates of manual training desire to introduce it not for the general development of mental power, but for the "mere manual dexterity" that may result, Dr. Dickinson certainly repays the compliments that those he opposes have been paying the public school system as to the mechanical manner in which the pupil there performs his tasks. The experience of the president of an institution in the West, though convincing as to the necessity of mental training, would seem to ignore that manual training is not to supersede, but, as it is claimed, to supplement it.

But what is the specific difference between these arguments so far as the latter has been given? On one side a defect is charged, and a remedy—"construction and delineation"—offered. On the other, construction, under the title of mechanical dexterity, is flatly denied as a remedy for the imputed defect and delineation, under the title of drawing, admitted in the following terms:

"Drawing," Dr. Dickinson continues, "has an important educational value, and should be introduced into every public school in the land. It implies a careful and prolonged observation of things to be described. It presents occasions for the free exercise of judgment, imagination, and invention." Nor is there apparently any material difference between the educator and the association as to the result to be obtained by education. In concluding his article Dr. Dickinson uses the following forcible language:

"My friends, if we desire to construct such a system of public instruction for the youth of the country as will best prepare them to discharge with efficiency and fidelity the duties of private and public life, let us make ample provision for the complete training of the powers of observation, for an accurate knowledge of facts, of analysis and comparison, for a knowledge of the relations of things, of generalization and reasoning, for a knowledge of those general truths from which the rules of conduct should be derived, and, above these things, for that training which leads to an all-controlling love for the truth; and the youth will take their places in life elevated above the narrowing effects of any trade, occupation, or profession, and ready to enter upon any service to which they may be called." The association says with emphatic brevity that manual training is a training of the mind to accuracy of perception and truthfulness and readiness of expression. The schools are not established for the purpose of teaching pupils how to make a living, but to teach them how to live.

Construction or mechanical dexterity, as either side may prefer to call it, is then the main point of difference. Now, what defect is it intended to remedy? "Nowhere in the present school course," says the association, "is any provision made for training the judgment and executive faculty than which no mental powers are of more practical importance." "What changes do we need?" says Dr. Dickinson. "If the defect is found in a failure to cultivate practical power, then the change we need is not so much in the course of studies as in the method employed in presenting these courses to the learner's mind. If the children graduate from the schools without the ability to do any independent work, it is because their school exercises did not permit nor require them to do independent work in mastering their lessons. The great reform we need will be introduced by turning the learner's mind from words to things; I do not mean physical things only, but all things which may be made objects of thought. * * * The pupil may become an original investigator by being trained to handle the objects of his investigation. This training leads to self-control and prepares one to take up the work of life with every prospect of success." In this there exists substantial agreement, although Dr. Dickinson speaks rather hypothetically as to the reality of a defect; indeed, the last argument is the more reasoned.

But what kind of investigation? And here it is that the difference appears. Having first recalled to the reader's attention that tool instruction is said to be demanded by the advocates of manual training, we will quote once more and finally from Dr. Dickinson:

"If the children in our elementary schools could be trained to study in a philosophical way the elements of the sciences, they would not only prepare themselves for the future pursuit of the sciences themselves, but at the same time they would be put to those exercises that are best adapted to train the mind to a skilful use of the hand and eye."

PHILOSOPHICAL APPARATUS AND SCIENTIFIC KNOWLEDGE OPPOSED TO TOOLS AND CAPACITIES FOR USEFUL ACTION.

Philosophical apparatus is thus decidedly preferred to tools, as merely requiring a change in the manner of teaching a subject that has already been introduced into academic and perhaps, in some instances, into lower grades of the schools and is now acknowledged to be in harmony with their object. This suggestion is supported by the remarks of a writer in a journal¹ of the highest standing which we quote:

"The pleas for manual training as an educational measure are many, and as the methods employed in instruction must necessarily depend upon the end expected it may not be amiss to examine at least the leading theories.

"Such a critique, nevertheless, based upon the campaign of words, if we may so call them, of the different advocates, in the absence of a full exposition of their views, must be made rather in the form of suggestion than otherwise. Thus the first encountered is that of the *development of perceptions*. One would assume a psychological basis if the age of the pupil corresponded with the programme in view; but in the present application perceptions means sharpness of the sensorium, the first stage of mental growth in the child, generally expected to have been accomplished in the kindergarten; afterward, object teaching in the elements of natural sciences, aided by collections, etc., would do quite as well, and, moreover, would produce as a beneficial result certain general knowledge not attainable from the simple manipulation of tools." It will be observed that "general knowledge" is here balanced with "simple manipulation" to the advantage of the former.

Comparing these suggestions with the statements made by Lord Armstrong, the head of the Elswick Company, which employs 13,000 men and boys, but better known to the American public as Sir William Armstrong, of rifled cannon fame, considerable difference of opinion in this matter is shown. Lord Armstrong, consulting his experience, prefers capacities for *useful action* to the possession of mere knowledge.

In an article entitled "The Cry for Useless Education,"² a reply to a criticism³ by Sir Lyon Playfair, president of the British Association for the Advancement of Science, on Lord Armstrong's article, "The vague Cry for Technical Education,"⁴ this distinguished engineer observes: "A man's success in life depends incomparably more upon his *capacities for useful action* than upon his acquirements in knowledge, and the education of the young should therefore be directed to the development of faculties and valuable qualities rather than to the acquisition of knowledge. * * * I can affirm with confidence that had I acted upon the principle of choosing men for their knowledge rather than their ability, I should have been surrounded by an incomparably less efficient staff than that which now governs the Elswick Works."

It is necessary to ascertain what Lord Armstrong means by knowledge and "capacities for useful action." To give this we will quote from "The vague Cry for Technical Education," an article that caused Sir Lyon Playfair to wonder why the author was not a member of the "Technical Association" of England:

"In expressing my own views on popular education I must address myself in the first place to the present system of primary or elementary education, which is now very generally considered to be ill-adapted as a preparation for the business of life. That system has in my opinion the radical defect of aiming at instruction in knowledge rather than the training of the faculties. * * * Not only should the mind be trained in habits of thought, and in quickness and accuracy of perception, but the hand, the eye, and the ear should all participate in training exercises calculated to make those organs more available as instruments of the mind. * * * Except in teaching the art of writing no attempt is at present made to educate the hand. The addition of drawing would be a step in the right direction, and would afford a useful accomplishment, but would not supply all that is needed for giving dexterity to the hand. Appropriate exercises ought to be devised for cultivating its mobility, precision, and delicacy of touch; and if, in so doing, the ability to use simple tools were acquired *it would be advanta-*

³ Nineteenth Century, September, 1888.

⁴ Nineteenth Century, June, 1888.

geous in any line of life that might be ultimately adopted. Every man and woman would be the better for pre-acquired manual dexterity, but to attempt to teach children special trades and processes of manufacture would, I conceive, be a mistake."

We can now return to the "Cry for Useless Knowledge," and quote some important lines without fear that they will be misunderstood. "Sir Lyon Playfair declares himself an advocate of including within the scope of technical education the teaching of specific trades and industries. I, on the contrary, say that workshops and factories or other places where actual business is carried on are the proper schools for the learning of such trades and industries. Here at once we stand face to face in diametrical opposition. Nor is our agreement more apparent in his definition of the object of technical education, which, he says, is 'to give an intelligent knowledge of the sciences and arts which lie at the basis of all industries.'"

It would certainly appear from the foregoing that Lord Armstrong, though no believer in teaching trades, is strongly in favor of manual training as that term is used here, and that if Sir Lyon Playfair, an enthusiastic advocate of technical training, courted his alliance as one "cool of judgment, unaffected by enthusiasm or emotion," his expression in favor of manual training should be of considerable weight. But it is not our purpose to discuss the respective merits of the two systems for accomplishing the double object of educating the "executive faculty" and giving "dexterity to the hand." Assuming that a "philosophical" study of the sciences, together with the manipulation of scientific apparatus, is equally adequate to accomplish this twofold end, as the advocates of the other system claim that tool and "construction" work are, it would appear that the matter is merely a question of utility—would the ability, capacity, as Lord Armstrong calls it, of making a delicate scientific experiment be of more use in every day life of the great majority than the ability to make a table?

From considering transatlantic opinions let us turn to the consideration of a transcontinental one. The paper from which we shall quote bears the title, "Sense Training and Hand Training in the Public Schools,"¹ by Professor Le Conte, of the State University of California, in which he has the chair of geology and natural history.

Psychical life, he said, is made up of three departments—the senses, the intellect, and the will; that is, observing, thinking, and doing. Development is only possible through the coöperation of these. In natural education the three are coördinate, but they are not coördinate in the artificial education of the school-room, for that is at best but reading, thinking, expressing. By construing passages, solving problems, and writing exercises, good hard work may be obtained, for language, mathematics, logic, and philosophy are admirably adapted to book methods. But book work in science is a sham; of all school studies it is the most trifling. Science must be taught by new methods. Observing and doing must coöperate with thinking. There are three great departments expressly adapted for this coöperation—natural history, drawing, and hand work.

"Hand work, [we regret that our object permits us to give the line of argument on this head only] does not mean trade work," industrial work, as this Office is calling it. "There is a kind of perversity in the average mind on the subject of education. If there be any chance for a wrong point of view it is sure to be taken. This subject, under the title of 'manual training,' has been much discussed of late, but mostly by both friends and foes under a misconception of its true function. It is urged by the people and by many educators because of its supposed practical utility, because it prepares for life in a special way, because it is an apprenticeship to trades. * * * Why should our schools prepare for one pursuit more than another? Why trades more than professions and shop-keeping? By all means let there be trade schools, technical schools, special schools of many kinds if it be deemed necessary, but let not these be connected with our public school system. * * * Hand work, if introduced at all, should be not for making carpenters or blacksmiths, but to train the brain by coöperation of hand and eye."

There are many other matters in the several essays quoted from that are exceedingly worthy of our attention, but space is wanting. It is desirable to fix the connotation of the term manual training as a theory of education; if in the endeavor to do this other points have been brought out, they are incidental. In stating the high claims of instruction in science as practically set forth in Tyndall's "Lessons in Electricity,"² and Huxley's "Practical Biology," Prof. von Taube's article has been quoted from. It is not to be assumed, however, that his attitude is one of hostility towards manual training. "We are far from condemning the instruction, and from making a crusade

¹ Read before the State Teachers' Association of California, December, 1887.

² "Last Christmas it fell to my lot," says Prof. Tyndall in his paper, "to give one of these courses [at the Royal Institution]. I had heard doubt expressed as to the value of science teaching in schools, and I had heard objections urged on the score of the expensiveness of apparatus. Both doubts and objections would, I considered, be most practically met by showing what could be done in the way of discipline and instruction, by experimental lessons involving the use of apparatus so simple and inexpensive as to be within everybody's reach."

against the selection of branches even," he says. "Having visited educational institutions in many countries, the writer considers the American system superior to the others, and as most assuredly answering well the purpose intended. The only question is, whether that purpose is desirable?" To the general objection that "the State has no right to prescribe the future occupation of the growing generation," he would reply by saying, "Has the State the right to educate for no special occupation, although such is unavoidable in actual life?" In short the professor's article is rather an examination of the present condition of educational affairs than an argument for or against manual, or perhaps, as we should say, industrial training.

THE NECESSITY OF MANUAL TRAINING TO THE CITY BOY.

There is another point of view from which this subject of manual training may be considered, and as it will aid in fixing the difference between manual training and industrial or trade training, the indulgence of the reader is asked while a quotation is given from General Francis A. Walker's paper on "Manual Education in Urban Communities."¹ Those who have remarked that our great men have spent their early years on a farm, and who believe in manual training may perhaps, in this, find a reason for their greatness.

"In the country the boy finds a hundred opportunities, alike at work and at play, for acquiring much of that which can only be given to the city boy by way of formal instruction. Whether in his daily stint of labor upon the farm, about the house, the barn, the sheds, or in his sports or rambles upon the village green, over the field, through the woods—the country boy has incessant occasion to use his hands and his eyes; to observe, to plan, to do." The writer then speaks of the benefit of systematic instruction and continues thus:

"Yet in spite of the deficiencies which remain, after almost any amount of spontaneous practice at work or play, or practice under direction from those who are masters neither of the special arts involved nor of the general art of teaching, what the country boy enjoys in the way of training hand and eye to be true servants of the mind; what he enjoys in the way of opportunities and incentives for making the mind itself the real master of life, through a well-round and harmonious development of all the powers, through the creation of the spirit of self-reliance, through the exercise given to the constructive and executive faculty, is almost infinitely greater than that which falls to the lot of the unhappy city boy of to-day. Out of school what has the latter to do with himself, his time, or the energy given to him, as we are wont to say, for some good purpose, though it would puzzle the most devout and the most ingenious to tell for what purpose energy should have been given to a boy condemned to live in a modern city?"

In this effort to fix the meaning of the term manual training as a theory of education one argument—the industrial—has not been examined, and for obvious reasons; it is not an educational argument, but a matter of political economy; not an argument for development of the intellect of the individual, but for rendering him a proper member of a wage-earning community. An examination of this kind would inevitably open up the question, "What shall the public schools teach?" an examination that has no place here. The argument, however, will be noticed under industrial instruction, which forms the second topic treated in the chapter.

MANUAL TRAINING NOT TO SUPERSEDE BUT TO SUPPLEMENT.

If, as Professor Huxley says, the present work of the schools is too bookish; if Lord Armstrong is perfectly correct in asserting that the present system of elementary education has the radical defect of aiming at instruction in knowledge only; if the defect is found in a failure to cultivate practical power, as Secretary Dickinson hesitates to admit and the New York Industrial Association unhesitatingly asserts, then it is a mere truism to say a remedy is needed. The advocates of manual training urge its claims on educational grounds. These grounds we have found are not urged in hostility to the object of the public schools, but rather with the view of assisting them to attain it; in brief the principal difference lies in the manner and means of attaining a desirable end rather than in a difference of aim. These means and this manner will, therefore, receive attention in the following section, in which, since this agitation is European as well as American, we will not scruple to introduce the curricula of foreign nations, or to be liberal in quotation.

Before turning to this inquiry, however, the remark may be ventured that in all countries there appears to be not a little danger that the great advantage that concrete ideas have, in the matter of public comprehension, over abstract ones may give this propaganda the appearance of a socialistic agitation and that at home the advocates of manual training in putting such stress on carpenter's toolwork may be placed in the position of advocating undesirable means rather than a very desirable end.

¹Proceeding of the National Educational Association at Chicago, 1887, p. 196.

II.—MANUAL TRAINING STUDIES AND CURRICULA.

In taking up the study that we have placed first in this presentation of the several elements of the manual training course, we beg to digress so far from the direct treatment of our topic as to explain the methods we have followed. We fear that by many it will be expected of us that we write an infallible scheme for establishing, fitting up, and carrying on a manual training school or course, like complete manuals are being constantly written for "learning to speak, read, and write" a foreign language. Nothing could be more fallacious than such expectation, particularly in regard to the undeveloped subject of manual training. All we can do is to illustrate each study or period of the manual training course by a programme that is in *actual* operation. It must be remembered that our volume is a year book, not an encyclopædia of education, and that it deals primarily with the events of a twelvemonth, and not with the application of the principles of a noble and highly complex science.

DRAWING.

In the preceding section manual training as a theory has been examined; it is now time to examine the means with which it proposes to accomplish its object. Of these drawing stands in the very front rank, not only by reason of its intrinsic value and the appreciation that the public, having grown warm to it, accords, but from the continuity with which as a study it is pursued from first to last. The object of manual training is to add the powers of expression *by delineation* and by construction to the pupil's power of expression by verbal description, says the New York Association.

"For long years," says M. Louise Field,¹ "the public stood with its finger upon the pulse of this alleged intruder, fearful lest it bring disease and disorder; it has now passed the quarantine stage; it is found to be not only safe, but salutary; no longer an alien, it is fast becoming an ally; once a question of 'to be or not to be,' it is now largely a question of 'how to be at its best.' * * * Under the study of a language we may include the thought or the form of its expression, or both. This is no less true of drawing. It is with reference to that which is expressed, rather than the expression, so far as they can be separated, of which I wish more particularly to speak.

"Drawing being essentially the 'language of form,' has in its widest sense the whole visible world as its world. * * * We may recognize the facts of some complicated cathedral; we must recognize those of the cube; we are at liberty to enjoy the most pleasant pictures, but not at liberty to neglect the perspective of a simple prism; nothing excludes us from a knowledge of the most complex ornament; we include among the necessities a knowledge and practice of the elementary principles of decorative design.

"As regards drawing in the normal school I shall assume we are agreed that a part if not the whole duty of its special teacher lies in the selection of these essential features of a common school course, and their presentation, according to the best methods, first by the teacher, second by the pupils in practice teaching, involving, as this must, the educational and practical philosophy underlying the same.

* * * * *

"The advantage of this I hold to be two-fold: First, it is personally educative, begetting that habit of mind which sees nothing as an isolated fact, but as a part of a whole and which ever reaches out through the variety of truths, up to the unity of truth. Second, it is professionally economic. * * * The cone, whose appearance I indicate before recess, becomes the mountain peak of the later morning; and it is that of which I find the solid contents in the afternoon."

Should it be objected that the latter part of the foregoing quotation refers to the training of teachers only, the reader is referred to the testimony of the secretary of the Massachusetts board of education, given on page 834, as to the value of the instruction. As to drawing as a "power of expression by delineation," an extract from a paper read before the National Teachers' Association in 1882, by Professor Woodward, of St. Louis, will illustrate what is meant:

"I desire, for a moment, to direct your attention to the arts of expression. Next in rank to the ability to think deeply and clearly is the power of giving clear and full expression to our thoughts. This last can be done in various ways. As this brings me squarely upon a subject I wish to impress strongly upon you, I will illustrate it by a somewhat elaborate example:

"A gentleman recently called upon me for my opinion concerning a certain automatic brake for freight cars. The device was new to me, but it lay pretty clearly defined in the mind of my visitor. It was not original with him, but for the purposes of my illus-

¹ Drawing in the Normal Schools. Proceedings of National Educational Association, Chicago, Ill., 1887.

tration it might have been. Before I could pass judgment the device must lie clearly in my mind, perhaps more clearly than it did in his; so he set out to express his thought. He was what we call well educated, being a graduate of the oldest university in the land, and was well versed in the conventionalities of spoken and written languages. Accordingly, he proceeded to utter a succession of sounds. His lips opened and shut with great rapidity, and without intermission a series of sounds fell upon my ears. The sounds I heard were quite familiar to me, as I had been listening to them in one order and another for over forty years, and as they had always been associated in my mind with certain concrete things, and the relations of such things to each other, certain thoughts about those things began to take shape in my mind.

"Of course, the sounds I heard had not the smallest likeness to the things called up by them in my mind. * * * The ideas aroused in my mind were confused and fragmentary, and altogether unsatisfactory. Had my friend resorted to writing a description of the invention, in either English, French, German, Latin, or Greek, using in every case a set of purely conventional symbols (to represent the other set of conventional sounds), which we had both spent years in getting some knowledge of, he would have succeeded little better. Whether speaking or writing, much of his thought he could not clothe in words. He therefore abandoned the wholly conventional, or verbal, art of expression and turned to the pictorial.

"But here he soon confessed that his education was deficient. He had never studied the art of representing objects having three dimensions on a surface having but two, and hence he was ignorant of the methods he ought to adopt to express by drawings the objects he was thinking of."

In the quotation from Lord Armstrong's article (p. 835) it has been seen that he advocates drawing as training for the hand, and in his address on "Manual Education in Urban Communities" the president of the Massachusetts Institute of Technology agrees "with Dr. Runkle that drawing in the public schools, not directed upon work in the mechanic arts, is not one-half of what it would be as an educational force had it a definite object." "I look with confidence," he continues, "to see this most interesting and promising study receive a new inspiration wherever the use of tools is introduced into the schools."

It is not necessary to give a programme of a drawing course; the educational public is quite familiar with the subject, and we have only attempted to show its share in "manual training," of which it forms so important a part.

THE KINDERGARTEN.

Whether the kindergarten, like the public school system, the normal school, the school for the blind, drawing, manual training, and an American of educational genius, first appeared upon the soil of Massachusetts, we do not know,¹ but it is not until the report of 1882 of the board of education of that remarkable State that the kindergarten is brought into company, though not associated with manual (or industrial) training. The board says, in discussing the subject of industrial education: "The intense eagerness of the American people to make capital and labor produce the greatest results and the greatest amount of good to the public, will doubtless ere long compel a fuller investigation and discussion of technical education. Its very importance and the complications that may arise in attempting to engraft upon our own peculiar institutions systems that have grown up in other countries and under circumstances widely different from our own,² alike forbid that the subject should be thrust aside without a careful and unprejudiced investigation, or that hasty and inconsiderate attempts should be made to incorporate it into our system of common schools. * * *

"Another kind³ of educational work of rising importance is the peculiar system of elementary training known as the kindergarten—a system which aims by simple and natural methods to lead the child-mind to form habits of observation, of self-activity, and self-development, and thus to become under judicious training a self-educator. The principles of this system seem to be founded upon a knowledge of child nature as learned by wise and observing teachers and mothers. The great importance of our primary schools, the only grade of schools of whose advantages all our children partake, and the general feeling among educators that there is now in these schools too much drudgery, considerable waste of time and effort, and not sufficient attention given to imbuing the

¹ From Boone's Education in the United States (N. Y., 1889) we learn in time to replace a former note that the first kindergarten was opened at Watertown, Wis., by Mrs. Carl Schurz, in 1855. Having been made acquainted with the idea by this lady, Miss Peabody opened a school in Boston, in 1860. In 1867 the school committee of Boston was petitioned by Miss Peabody, Mrs. Russell, and Mrs. Hemenway and others in the matter of kindergarten instruction.

² It will be noticed that in their report the members of the special committee on manual training of the board bear upon the similarity of American and Swedish life (p. 827).

³ These words are not italicised in the original.

child with a fondness for learning, should move us to welcome any light upon the subject that may appear within the sphere of our observation."

This was in 1882, three years after the school committee of Boston had decided to close the kindergarten established in 1870 in connection with the public school for the following reasons:

"It is not denied the school proved a decided success. * * * As the experiment had succeeded, the logical and consistent course would seem to be to establish a sufficient number of such schools to accommodate all children of the kindergarten age; but the expense of such an undertaking * * * seemed to the board too great to assume without a more general and pronounced demand on the part of the public."

At St. Louis, which with Boston, San Francisco, Philadelphia, and New York City have been the great centres of kindergarten work, a kindergarten school was established in connection with the public schools in 1873. Its value for "industrial preparation" was recognized as a "sufficient justification for its introduction into our school system," in 1879, by the superintendent of St. Louis, who continues: "There is much else which is common to the instruction in the school subsequently and occupies the same ground; * * * there is a cultivation of the imagination and of the inventive power which possesses great significance for the future intellectual growth. The habits of regularity, punctuality, silence, obedience to established rules, self-control, are taught to as great degree as it is desirable for pupils of this age, but not by any means so perfectly as the ordinary well-conducted primary school."

To these brief historical notes it is only necessary to add that the great objection to kindergarten training has been that it failed to inculcate those habits of attention and self-control which are deemed necessary in the primary school to promote order and progress. As far as the Office can find, the effort of the advocates of the kindergarten seem to have been directed towards convincing the public that their methods are better adapted than the usual methods of the primary school, to prepare the pupil for the usual school work. They do not appear to be so desirous of bringing into notice its value as manual training.

In the report of the committee on course of study and school-books of the board of education of New York City the connection of manual and kindergarten training is plainly put. The committee says:

"The question of what shall be done for all pupils, boys and girls, is the most important one involved in the consideration of manual training as a part of common-school instruction. It has received the attention of many of our most eminent educators, and the practical results of their careful study and experience are substantially embodied in this report.

"The general features of the plan may be readily understood. Many years ago the kindergarten of Froebel was introduced into this country. Like manual training, it is one of those new and fresh conceptions of true education which must, from time to time, continue to arise with the advance of our knowledge of those scientific principles which underlie all education. * * * Although of widely different origin and purpose, its close pedagogical relations to manual training, and the identity of their fundamental principles become, upon investigation, at once apparent. It is now seen that neither the kindergarten nor manual training has yet reached its full and proper extension and development, and that the wide gap at present existing between the kindergarten and the high school (Manual Training Department of the N. Y. City College?) may be readily filled by extending the methods of the one upward through the primary school and the method of the other downward through the several grades of the grammar school. This will be a safe and proper application of that fundamental principle which should underlie and unify the whole course, namely, the development of certain faculties and aptitudes by the cultivation of the sense perceptions, to insure correct conceptions of form, and to test and manifest their accuracy by embodiment in material."

FROEBEL'S DEFINITION OF EDUCATION AND HIS "GIFTS."

The most trustworthy expounder of a doctrine is the man that originated it, and if his doctrine be commented upon by a disciple of learning and ability, it may be used as though a matter of to-day. Such a doctrine and commentator has recently been given to our educational public in the translation of Froebel's *Education of Man* by Superintendent Hailmann, of La Porte, Ind.

In this work education is said to consist "in leading man, as a thinking, intelligent being, growing into self-consciousness, to a pure and unsullied, conscious, and free representation of the inner law of divine unity, and in teaching him ways and means thereto." Some pages on the author says, "The educator, the teacher, should make the individual and particular general, the general particular and individual, and elucidate both in life; he should make the external internal and the internal external, and indicate the necessary unity of both; he should consider the finite in the light of the in-

finite and the infinite in the light of the finite, and harmonize both in life; he should see and perceive the divine essence in whatever is human, trace the nature of man to God, and seek to exhibit both within one another in life." These, of course, are dictums, generalizations of a meditating mind, but it is perfectly evident that the education that Froebel has in mind is more intended to develop the human soul than ability to struggle for existence.

The kindergarten uses two material means of instruction called respectively gifts and occupations. The gifts are divided into (1) Bodies—balls, cylinder, divisible cubes of several kinds to be taken up progressively; (2) Surfaces—squares and triangles; (3) Lines—straight and circular; (4) Points—seeds, pebbles, etc.; (5) Reconstruction—the construction of lines with points and so on back. The occupations are (1) Solids—plastic clay, card-board work, wood-carving, etc.; (2) Surfaces—paper folding, paper cutting, parquetry, painting, etc.; (3) Lines—interlacing, intertwining, weaving, thread games, embroidery, drawing, etc.; (4) Points—stringing beads, buttons, etc., perforating, etc. "The gift gives the child a new cosmos," says Mr. Hailmann; "the occupation fixes the impression made by the gift. The gift invites only arranging activities; the occupation invites also controlling, modifying, transforming, creating activities. The gift leads to discovery; the occupation to invention. The gift gives insight; the occupation power." This brings us to

CONSTRUCTION WORK (IN PAPER AND CLAY).

This is the new term used to denote the instruction advocated by the New York committee to fill the gap between the kindergarten and the manual training school, in the primary and lower grades.

DR. ADLER'S "CREATIVE METHOD."

About 1880 the Society for Ethical Culture of New York inaugurated what Dr. Adler in an article in the *Princeton Review*¹ calls "A New Experiment in Education."

"With the initiation of the enterprise," says that writer, "the heart had quite as much to do as the head. Those who entered upon it were inspired by the hope of contributing in some degree to the relief of the masses, and were impressed with the belief that an improved educational system is the most efficacious means to this end, indeed, the only measure that promises to pluck up the poisonous weed of pauperism at the root."

What are the means that this new experiment would use to enable it to be efficacious where old ones had signally failed? "What Froebel began in the kindergarten," says the doctor, "is here carried out on a higher plane and with much greater minuteness of detail." The fundamental geometrical conceptions are made clear; drawing and "technical" work are intimately connected; elementary facts of mechanics are inculcated by constructing mechanisms, of physics by constructing, as far as possible, scientific apparatus. The author would call this the creative method. He does not like the ambiguity of "industrial education" and makes some exceedingly caustic remarks on that party which seeks to make the mass of mankind more machine-like than they already are.

CONSTRUCTION WORK AN EXTENSION OF THE KINDERGARTEN.

The Office is not prepared to say that this was the effort that guided the New York committee.² It will be observed that it, too, would extend the kindergarten principles up-

¹ March, 1883, number.

² In his work, "The Manual Training School," Prof. Woodward, of the St. Louis Manual Training School, quotes from an essay read by him before the St. Louis Social Science Association in 1878, in which he said: "The manual education which begins in the kindergarten should never cease. Just how we shall supply the missing links in the chain which joins the kindergarten with the fully equipped shops of the polytechnic schools we cannot with certainty suggest. The problem is an open one, and thousands of earnest and intelligent educators are devoting themselves to its solution." In 1882 Mr. Charles G. Leland, of the Philadelphia School of Industrial Art, was more definite in his line. In Circular No. 4, 1882, of this Office he says: "Of late years it has been definitely ascertained that very little children in the kindergarten organized on the plan of Froebel are capable of developing much more artistic ability than has been supposed; and this, far from straining the mind, strengthens it. If a child can learn to sew, read, sing, draw, and model in the kindergarten, it can surely pursue higher branches, both literary and manual, in higher schools. * * * It is a remarkable law of nature or of humanity that all the minor arts, or such branches of industry as are allied to ornament, are very easy, and can generally be so far mastered in a day by anybody who can draw as to enable the pupil to produce a perfectly encouraging result. But industrial art, to be taught in schools, need not and should not be limited to ornamental work. This is to be at first followed simply because it is the only work easy enough for children and girls. Carpenter's work, or joinery, in its rudiments, or in fact any branch of practical industry, may be taken up as soon as the pupil is fitted for it. Industrial art in schools covers the ground or fills the time intervening between the kindergarten and the industrial school, but it blends with and includes the latter. It is characteristic in this, that the system, as I conceive it, is capable of being introduced into every public or private school in the country or into any institution where there is a preceptor who has some knowledge of drawing, with sense enough to apply it according to certain elementary hand books of art."

ward, but would do it in the following way: "Construction work should consist of work in paper, pasteboard, and other suitable material for boys and girls," and these and clay modelling are the material used. In the first years of the course clay is used in forming geometric solids and forms based upon these as types. Stick laying, a term used to designate the formation of triangles and other geometrical forms; paper folding (paper cut after folding to make simple designs); and tablet laying (cutting forms to represent the surfaces made in clay) are, with drawing, which is used to represent the objects formed, the work of the beginner. From these simple manipulations the pupil advances into more complex forms, always drawing what he makes, or making what he draws. It is understood that in some instances clay or putty is used for work in geography. No information is yet at hand that clay is used in teaching physiology, as it is in the Perkins Institution for the Blind. The implements used in this work are the fingers, a pair of scissors, and a paste-brush.

Carving is also a Froebelian occupation. This, however, is not always included in the manual training course. It forms a part of the course in hand-craft of the Moline, Ill., public schools, where it is introduced in the 4th year. An unburnt brick is the material operated on, and the tool but a dull knife, and not until the 7th year is the pupil put on wood. It should be said that Moline has no carpentry-tool work.

In an essay published by this Office¹ Mr. Leland remarks of wood-carving:

"I consider that, as a general rule, the three branches of design, embroidery, and modelling are the best to introduce into an ordinary school. Yet in some places wood-carving may be preferred by pupils or parents to modelling, as I have known it to be the case in England; or it may in time be added to the three branches already described. For wood carving a very strong common table and about two dollars' worth of good tools and fifty cents' worth of wood to each pupil may be called an outfit. The steps in wood carving from mere drawing to cutting are very gradual. It is to be desired that children in schools should be confined to 'flat cutting,' which is easy and profitable, and not be led at once, as they are in many schools, to ambitious and difficult sculpture 'in the round.'"

The course of the Moline public school will well illustrate construction in paper and clay, and wood-carving.

COURSE IN HAND-CRAFT FOR THE GRADES BELOW THE HIGH SCHOOL, MOLINE, ILL.

"*Object.*—1. To teach the pupil another language (drawing and making), by means of which he may be led to appreciate thought in and to interpret and express thought through form. 2. To develop the æsthetic nature of the pupil, and thereby to increase his capacity for enjoyment through an appreciation of the beautiful in art and nature. 3. To cultivate the industrial disposition by leading the pupil to do what, to him, is distinctively creative work.

"*Time.*—The time designated for drawing on the programme, and one hour every Friday afternoon.

"*Note.*—The work contemplated by this course is not new. With few exceptions it has been done and found wholly practicable under the conditions which make the ordinary school-room. It is not offered as a perfect scheme. It is simply a more definite plan for securing some of the results already recognized as desirable.

"The course provides work for both boys and girls. Much of the work may be given to the whole school at the same time; occasionally it will be found necessary to give boys one thing, and the girls another thing to do at the same hour. Work planned and begun in school may be finished at home if the teacher thinks it advisable.

"Pupils should be led to see that drawing is the basis for most of the making. In the first and second years the pupil passes from the objects to their symbols; after this from symbols to objects."

¹Industrial Art in Schools, by Chas. G. Leland, of Philadelphia, Circular of Information, No. 4, 1882.

First Year.¹

CLAY MODELLING: Simple geometrical forms—sphere, cube, cylinder, hemisphere, square prism, triangular prism. Natural and other forms derived from these, as apple, cherry, peach from sphere; hat, cap, dish, bird's nest, umbrella, toad-stool from hemisphere; book, brick, domino, box from square prism; dice and box from cube; vase, bottle, jug, rolling-pin, spool, fire-cracker from cylinder. Let pupils name other objects that are examples of cube, sphere, etc.

TABLET LAYING: Circle, semi-circle, square, triangle, and oblong, representing the faces of preceding solids. Combined from dictation and invention to form pleasing designs, by horizontal and vertical repetition, and by symmetrical arrangement about a centre. Have pupils cut tablets out of colored paper and combine as above. Examples of circle, triangle, etc.

STICK LAYING: Sticks of different lengths and colors representing edges; joined to represent squares, angles, triangles, oblongs. Ornamental arrangements based upon these. Similar work with sticks and peas, and skeleton representation of solids.

PAPER FOLDING: Square and triangle taken for base form. Have pupils cut paper after folding to make simple designs. Lead pupils to discover familiar objects folded into squares and triangles, as napkins, soldier-caps, fans, etc.

DRAWING: Representation of edges, angles, and faces of solids, derived forms, tablet designs, etc. Lead pencil and paper used for drawing.

Second Year.¹

CLAY MODELLING: Review solids of first year. Take up in the same manner ellipsoid, ovoid, equilateral triangular prism, cone, square, pyramid, and vase form. Natural and other forms derived from these, as plum, lemon, potato, bean, English walnut, leaf, spoon from ellipsoid; egg, acorn, pear, strawberry, leaf, mouse, chicken, spoon from ovoid; carrot or parsnip, top, tumbler, flower-pot from cone; paper-weight, monument from square pyramid. Let pupils name other objects that are examples of ellipsoid, ovoid, etc.

TABLET LAYING: Broad and narrow ellipse, oval, equilateral, isosceles and right-angle triangle representing faces and sections of the solids named above. Combined from dictation, and invention for decorative designs, as in first year. Have pupils make ornamental arrangements, using tablets cut out of colored paper. Combine with tablets of first year.

STICK LAYING: Representation of edges and faces of second year solids. Ornamental arrangements as in first year. Work with sticks and peas, and skeleton representation of second year solids.

PAPER FOLDING: Take base forms of first year and make more difficult designs by folding, and by folding and cutting. By folding and cutting make cube, square prism, triangular prism, etc., bringing edges together without pasting. Make envelopes, etc.

DRAWING: Representation of edges, faces, and sections, derived forms, and tablet designs. Lead pencil and paper used for drawing.

Third Year.

DRAWING: Book 1, Prang's Shorter Course in Form Study and Drawing. Take first the work of the book, then supplement it with as much kindred work as time will permit. Lead pupils to see the language value of drawing, *i. e.*, that they may by means of it represent what has been constructed, and also that they may construct what is represented.

Pupils should and may be led early to see the three distinct uses of drawing in construction, decoration, and representation, and the relation of each to the others.

*Third Year—Continued.***DRAWING—Continued.**

In planning original designs for decoration, pupils should be encouraged to lay out their designs with sticks and tablets before drawing. Let *making* continually accompany the *drawing*. Pupils should be encouraged to look for counterparts of the forms drawn in natural and other objects to be found outside the school-room.

For further directions see Teacher's Manual for "Shorter Course."

PAPER CONSTRUCTION AND DESIGN: Starting with the forms in the drawing book, have pupils construct from the patterns which they draw the hollow forms, leaving laps and pasting. After this they should construct other simple but related objects from patterns, as boxes, envelopes, etc. Pupils should be encouraged to bring a variety of paper boxes and envelopes to school, to be taken to pieces as a class exercise for the purpose of finding how they are made.

Paper of one color may be folded and cut to form a stencil, so that, when pasted over paper of another color, effects in ornamental design will be obtained.

Pleasing ornamental effects may also be produced by cutting out of colored paper a variety of familiar forms previously drawn, and arranging and pasting on other colored paper to make borders, tile designs, rosettes, etc. In this and the stencil work the pupil should be led to use few colors and such only as harmonize.

CLAY MODELLING: Such forms in the drawing work as are suitable for moulding in clay, as shield, quarte-foil, raised and sunken; leaves, etc. Mould leaves on a base or plinth of clay.

In this grade the form should be drawn before it is moulded and the pupil led to compare the two means of expression.

OUTLINE EMBROIDERY: Some of the simple ornamental designs drawn may be worked out with embroidery cotton on butcher's linen, crash, muslin, and other materials. In this way the girls especially will have suggested to them designs for aprons, napkins, tidies, etc., just as pleasing, and much more appropriate, than the pictorial style of decoration which is so common. Teach pupils how to transfer design to cloth, using either perforated stencil or transfer paper.

PLAIN HAND SEWING: Exercises in running and over and over sewing practiced on small pieces of unbleached muslin. Pupils should be taught the size of needle and number of thread best adapted for this work; also the best way to hold needle and cloth when sewing, and how to thread needle quickly and easily.

Fourth Year.

DRAWING: Book 2, Prang's Shorter Course in Form Study and Drawing. Have pupils bring a variety of leaves to school for drawing. Beginning with those having simplest outlines, lead pupils to see how characteristic form may be represented by straight lines (blocking), as a step to finished outline. Pupils will be led to study outline of objects more critically and to get better proportions by this process.

For further suggestions and directions see third year work and Manual for "Shorter Course."

SHEET CONSTRUCTION AND DESIGN: For construction, see third year work. Let the forms in Book 2 be made the starting point. Pupils may make these forms in any sheet material that is suitable, working always from a pattern. Lead pupils to discover outside of school what objects are made from sheet material by cutting according to a pattern, and to name the materials thus used.

¹ The work for first and second year is based on the Prang Manual of Form Study and Drawing for Primary Schools.

Fourth Year—Continued.

SHEET CONSTRUCTION AND DESIGN—Continued. Stencils for decoration may be made not only by folding and cutting as in the third year, but by drawing the design on colored paper, and afterwards cutting out and pasting over another color. Pupils may begin to repeat the stencil units to form borders, centre-pieces, etc.

The ornamental work with paper, obtained by cutting units out of one or more colors, and arranging on base of another color, should be carried on as in third year.

In getting ornamental effects with paper, care should be taken not to require forms more difficult than those contained in the drawing-book for this year.

CARVING: Pupils of this grade may be taught to reproduce in low relief or intaglio on unburnt brick, most of the ornamental forms in the drawing-book. This work may be done with no other tool than a dull knife.

OUTLINE EMBROIDERY: In addition to work outlined for third year, the pupils may be taught to embroider in outline simple script initials for marking household articles, as napkins, towels, splashes, doilies, handkerchiefs, etc.

PLAIN HAND SEWING: Exercises in running, over and over, and hemming, practiced on small pieces of bleached and unbleached muslin. See third year for further suggestions and directions.

Fifth Year.

DRAWING: Book 3, Prang's Shorter Course in Form Study and Drawing. See fourth year work for suggestions. Study Manual for "Shorter Course" carefully.

SHEET CONSTRUCTION AND DESIGN: Lead pupils to apply the knowledge already obtained to making small useful articles, as pen-wipers, blotters with sheets fastened together by a ribbon, pencil-cases, match-cases, etc., drawing always preceding the making.

For other work in construction and for use of colored paper, see previous year and Manual.

CARVING: See work for previous year. Take up related work suggested by Book 2.

OUTLINE EMBROIDERY: See work for previous year. This year the work may be made something more than a mere exercise, by encouraging pupils to bring to school such useful articles as have been named, and others, and showing them how to apply their knowledge and skill in decorating and marking them.

PLAIN HAND SEWING: Review running, over and over, and hemming. Teach gathering. Combine these different kinds of sewing in exercises, using small pieces of cloth, or in working upon articles brought from the home. For the exercises use bleached and unbleached muslin and Lonsdale cambric.

Sixth Year.

DRAWING: Book 4, Prang's Shorter Course in Form Study and Drawing. While studying the vase forms pupils should be led to name the curves shown by the profile; to notice also how they are united to secure strength and a pleasing outline.

A short history of some of the more common vase forms will be appreciated by pupils of this grade and cannot fail to prove interesting.

SHEET CONSTRUCTION AND DESIGN: Continue the work in construction, taking up the more difficult single-piece box patterns, examples of which may be found in screw and tack boxes, and in ice cream and candy boxes. Pupils may also be taught to make portfolios of tough manilla paper or other materials, for holding stationery, letters, etc.; also portfolios and cases for photographs.

Sixth Year—Continued.

SHEET CONSTRUCTION AND DESIGN—Continued.

In addition to the work heretofore done in ornamental cutting, designs for registers, iron fences, iron and wooden crests, porch rails, brackets, etc., may be cut out of manilla board. If the design is for iron work the paper may be blackened with turpentine and lamp-black after cutting.

CARVING: See decorative work given and suggested in Book 4. Other ornamental Gothic forms as simple as the ivy leaf on page 8 may be taken for carving.

OUTLINE EMBROIDERY: See fifth year outline. Let pupils design monograms for marking, and embroider them on household articles, etc.

PLAIN HAND SEWING: Review other work. Teach Felling and Patching. Have pupils do patching on at least three kinds of cloth.

Seventh Year.

DRAWING: Book 5, Prang's Shorter Course in Form Study and Drawing. While studying the Fleur-de-lis form on page 7, pupils should learn something about its origin and history—the uses to which it has been put in decorative work.

Pupils should be required to make working drawings of simple objects, these drawings to be passed to other pupils and read, *i. e.*, a pupil who has never seen the drawing should be able to tell what object may be constructed from it.

CONSTRUCTION: Pupils should continue to construct articles out of sheet materials. The boys should be encouraged to construct at home, in wood, a few simple articles, following working drawings made at school.

SHEET DESIGN: Carry on stencil and other work with colored paper as heretofore. Continue work with manilla paper similar to that introduced in sixth year.

CARVING: In addition to carving on brick, give pupils a few simple exercises in low relief wood-carving. After these exercises have been planned and commenced at school, pupils may complete them at home. To fasten the wood to the desk for school-room work, a five-cent clamp should be used. Teach pupils how to transfer their designs to the wood.

OUTLINE EMBROIDERY: Work similar to that previously outlined, only more difficult.

PLAIN HAND SEWING: Review patching. Teach darning in cotton and wool.

Eighth Year.

DRAWING: Book 8, Prang's Text-books of Art Education, Clark edition. The difference in quality of lines used in instrumental and free-hand drawing should be made plain at this stage, and the reasons given therefor. It is quite important that pupils early learn the correct use and handling of drawing instruments, which are taken up for the first time in the exercises of this book.

CONSTRUCTION: See Seventh Year Work.

SHEET DESIGN AND STENCILING: Cut work with colored paper may be discontinued in this grade. Stencils may be cut of suitable paper, and the design stenciled in water-color and bronze upon tinted wall-papers. Continue cut work with manilla paper as in previous years.

CARVING: Let pupils do much carving on wood in this year, not only in exercises, but in decorating panels for cabinets, work-boxes, the ends of book-racks, etc.

OUTLINE EMBROIDERY: See previous work.

PLAIN HAND SEWING: Blind-hemming. Button-holes in cotton and woolen with lining.

TOOL INSTRUCTION.

In the remarks on the ideas connected with the appearance of the several elements of the American system of manual training, tool instruction is spoken of as if first appearing as an elementary school exercise in the Dwight Grammar School of Boston in 1882. This, exactly speaking, is incorrect.

THE GLOUCESTER (MASS.) EXPERIMENT.

In 1878 Miss Marian Hovey placed several hundred dollars at the disposal of the school committee of Gloucester, Mass., to enable it to make an attempt to unite the work of the shop with that of the public school. A shop was provided to accommodate twelve boys, to each of whom a rule, tri-square, hammer, jack-plane, jointer, smoothing-plane, bit-stock and bits, mallet, chisel, etc., was furnished. Forty lessons constituted the annual course, beginning with learning the names of the tools and finishing by making a box. The lessons were first given on Saturdays, but the novelty soon losing its effect, the members preferred their holiday to work, and other arrangements were made.

In 1880 the "carpentry class" was instructed on Monday, Tuesday, Thursday, and Friday (two classes each session) for a half of each afternoon, and the membership immediately advanced from thirty to ninety-six, about thirty of whom (two full classes, another partly) were girls, their work being quite as good as that of the boys. "The result is tangible," says the superintendent, "and the proficiency is measured by no arbitrary standard of percentages, but is clearly defined, and may be estimated with much more precision than in any other line of school work. I do not know of any manner in which fifty to eighty hours can be employed in any form of education where the practical results can be more satisfactorily determined. If the pupil never sees saw, hammer, or plane again, the training he has received will be of value whatever his vocation." This was said in 1880, the year the school was closed. Miss Hovey having spent \$750, refused to continue her contributions and the city board would not carry on the experiment at the public charge.

THE DWIGHT SCHOOL (BOSTON) EXPERIMENT AND ITS PRECURSORS.

On the first Thursday of January, 1882, an instructor, a carpenter, began his course to a class of eighteen boys in the Dwight School at Boston, "all who could be accommodated at the three benches at one time;" but we think that the experiment at the Dwight School was not a result of the founding of the Gloucester school, but that it owed its origin to home influences.

In 1872 a society known by the name of Industrial School Association established in Boston what was called a whittling school, carried on in the chapel of a Boston church of evenings. In 1876-77 this society united its school to the industrial school that had for two seasons been holding its sessions in the Lincoln Building, the supporters of the two schools organizing as one body under the name of the Industrial Education Society. The city gave them the use of the "ward room on Church street," where from 7 to 9 on Tuesday and Friday evenings the school, giving instruction in wood carving, was held. Firm benches were obtained, provided with a vise and carving tools for each of the thirty-two boys, ranging in age from twelve to sixteen. About half the pupils were still attending school.

The report, written in 1877, from which these facts are taken, closes thus: "The object of the school was [at the date of its inception], not to educate cabinet-makers or artisans of any special name, but to give the boys an acquaintance with certain manipulations which would be equally useful in many different trades. Instruction, not construction, was the purpose of this school. * * * Does not this incident show the natural sequence of such a course of hand culture as we have been describing upon the education in drawing now prevalent in our public schools? * * * We cannot but believe that it would be easy to establish in connection with all our grammar schools for boys an annex for elementary instruction in the half dozen universal tools; i. e., the hammer, saw, plane, chisel, file, and square. Three or four hours a week for one year only of the grammar school course would be enough to give the boys that intimacy with tools and that encouragement to the inborn inclination to handicraft, and that guidance in its use, for want of which so many young men now drift into overcrowded and uncongenial occupations or lapse into idleness or vice."

This suggestion may have originated from an acquaintance with the Russian system about that time being made known, although it will be seen by referring to page 827 that in 1882 the special committee of the State board, better informed, perhaps, of the distinguishing characteristic of the Russian system, recommended the Sloyd course as more adapted to a few lessons in a grammar school.

ORIGIN OF THE "CENTRAL SCHOOL."

In 1879 the Industrial Association offered its tools and other outfit to the Boston school committee, hoping that they would maintain the school as a public city school. In the same year the city council was petitioned on this subject, by whom the matter was referred to the school committee, and by that body to a subcommittee. The recommendation of the school authorities that the city should support, wholly or in part, "a developing school and school shops," to be engrafted permanently on the school system, was defeated in the council.

The superintendent of the city schools of Boston having in 1883 objected to shop instruction, as given at Dwight School experiment, on account of the great expense of providing each school with a shop, and having further discountenanced the introduction of manual training into the grammar schools, proposed a school bearing the same relation to the upper grades of the grammar school that the Manual Training School of Baltimore, for instance, now bears to the city high school; that is, a school with a curriculum modified so far as to permit half the day to be given to work and drawing. The school board modified this proposition by establishing a central school in the basement of the Latin School Building for the instruction, once a week for two hours, of a class drawn from each of ten schools. Thus originated the central school feature now so common.

This instruction in tool work is what the New York committee referred to as extending the manual training of the schools on the Russian plan down through the upper grades to meet the upward extension of kindergarten training through primary and lower grammar classes, the so-called construction work spoken of under the preceding head.

The implements used are the common carpenters' tools—hammer, saw, plane, etc., and the course a graded one of about forty exercises arranged in a progressive way. In the majority of cases the pupils are compelled to leave their building to receive the instruction.

To this tool work, in connection with sewing and cooking perhaps, the term manual training has been popularly applied.

As the course of the Moline schools is adapted to convey to the reader what is meant by the conservative form of manual training called construction, so the course in "manual arts" of the New Haven (Conn.) schools will show quite plainly that form of work which its friends call instruction in the care and use of tools, and its enemies "mechanics' tool instruction."

"LESSONS IN THE MANUAL ARTS" (USE OF TOOLS).

"Each tool when it is first used is described, the different parts named, and the way to hold and use it explained. After the boy has learned how to use a tool he is shown how to sharpen it on the oil stone, and is required to keep it in good order.

Lesson I.

HAMMER: Exercises in striking a block of wood with hammer, to show wrist, elbow, and shoulder movements, and to learn to strike "square." Exercises in driving nails of different sizes, perpendicularly, and in drawing them. Exercises in nailing two boards $\frac{7}{8}$ inch thick together, with nails of different sizes driven obliquely, and in drawing them.

CHISEL AND TRY SQUARE: Take board 6 inches square, mark out the corners square with try square and lead pencil; cut them out perpendicularly with 1-inch firmer chisel. Take board 6 inches square, round the corners with 1 inch firmer chisel, cutting perpendicularly; prove with try square.

Lesson II.

CHISEL TO LINE: Take piece 12 inches long, $\frac{1}{4}$ inches wide, $\frac{7}{8}$ inch thick, and mark with rule and compass a pointed arch, at one end, and a round arch at the other end; shape out with 1-inch firmer chisel, cutting with the grain from sides to center of arch.

HALVING: Take two pieces 6 inches long, 2 $\frac{1}{2}$ inches wide, $\frac{7}{8}$ inch thick, and halve them together, using rule, try square, single gauge, scratch awl, back saw, 1-inch firmer chisel, and cutting board. *Always use cutting board to save cutting the bench.*

HALF DOVETAIL: Make a half dovetail with one piece 5 inches long, $\frac{1}{2}$ inches wide, $\frac{7}{8}$ inch thick, and one 4 inches long, $\frac{1}{2}$ inches wide, $\frac{7}{8}$ inch thick, using same tools as in 2, except $\frac{3}{4}$ -inch chisel instead of $\frac{1}{2}$ -inch,

Lesson III.

END MORTISE AND TENON: Take piece 5 inches long, $\frac{1}{2}$ inches square, and form mortice on one end; take piece same size and form tenon at one end; using rule, try square, scratch awl, mortise gauge, back saw, $\frac{3}{4}$ -inch chisel, and bench vise.

BORING: Take piece 3 inches long, $\frac{1}{2}$ inches square, center the sides and ends with single gauge, put in the vise, and bore half way through with $\frac{1}{2}$ -inch bit; reverse, and bore from the other end. Repeat the above, using $\frac{3}{4}$ -inch, $\frac{1}{2}$ -inch, $\frac{3}{8}$ -inch, $\frac{1}{4}$ -inch, and $\frac{7}{16}$ -inch bits.

Lesson IV.

SAWING SQUARE: Take piece 12 inches long, $\frac{1}{2}$ inches wide, $\frac{7}{8}$ inch thick, mark two sides 1 inch from end, with try square and scratch awl, and saw off evenly. Repeat above, sawing off piece $\frac{1}{2}$ inch, $\frac{3}{4}$ inch, $\frac{1}{2}$ inch, $\frac{3}{8}$ inch, $\frac{1}{4}$ inch, and $\frac{1}{8}$ inch.

THROUGH DOVETAIL: Take one piece 4 inches long, $\frac{1}{2}$ inches square, and one piece 3 inches long, $\frac{1}{2}$ inches square, and make through dovetail. Using $\frac{1}{2}$ -inch chisel for cutting.

Lesson V.

JACK PLANE: Take piece 18 inches long, 12 inches wide, $\frac{1}{2}$ inches thick, place on bench, flat side down, end firmly against bench hub, and plane off a few shavings with jack plane, as set. Take the plane apart, naming its parts; put it together and practice setting it, comparing the shavings, until it is set correctly. Take piece 6 inches square, $\frac{7}{8}$ inch thick, mark off the corners, forming an octagon; using rule, compass, and scratch awl. Saw off corners, leaving line, and smooth edges with block plane.

Lesson V—Continued.

CROSS CUT SAW : Take board 8 feet long, 6 inches wide, $\frac{7}{8}$ inch thick, lay off a line with try square and lead pencil, 6 inches from the end, saw off, leaving line. Repeat above, sawing on the line.

Lesson VI.

GROOVING : Take piece 3 inches long, 3 inches wide, $\frac{7}{8}$ inch thick, and make a groove, $\frac{1}{4}$ inch wide, $\frac{1}{2}$ inch deep, through the centre, across the grain, using rule, mortise gauge, try square, scratch awl, back saw, bench hook, $\frac{1}{2}$ inch firmer chisel, bench vise, and cutting board.

Take piece 4 inches long, 3 inches wide, $\frac{7}{8}$ inch thick, cut a tenon on one end to fit groove; using same tools as above; round the ends of both pieces with firmer chisel, using try square to prove correctness of work; put together and test with try square.

RIPPING SAW : Take board 8 feet long, 12 inches wide, $\frac{5}{8}$ inch thick, mark off with single gauge a strip 2 inches wide; put it on the horse and saw to line; then put the board in the bench vise, one end resting on the bench pin; plane with jack plane, and true up with jointer, using try square to prove it. Repeat above, sawing on the line.

Lesson VII.

FRAMING : Saw from stock a strip 2 feet long, 1 inch wide, $\frac{7}{8}$ inch thick, using single gauge and rip saw. Square up with fore plane, trying plane, and try square. Saw off with back saw, piece 12 inches long, for stile, and one 5 inches long for rail. Form mortise in stile, and tenon on rail, using bench vise, back saw, bench hook, 1 inch firmer chisel, $\frac{5}{8}$ inch mortise chisel, and mallet.

Lesson VIII.

FRAMING (completed) : Drive together the pieces prepared in the last lesson and smooth face with block plane.

HALVING : Saw from stock piece 40 inches long, 1 inch wide, $\frac{7}{8}$ inch thick, using rip saw; square it up with jack plane, trying plane, and try square, gauging to thickness and width; cut off two pieces 12 inches long, and two 8 inches long, and halve corners together, making a frame with ends projecting 1 inch.

Lesson IX.

HALVING (completed) : Round the ends of the pieces prepared in the previous lesson, using compass, firmer chisel, and wood file; put together and smooth up with block plane.

SAWING AND PLANING : Saw from stock piece 12 inches long, 2 inches square; square it and plane all sides; cut from stock piece 4 inches long, 4 inches wide, $\frac{7}{8}$ inch thick; square it and plane all sides.

Lesson X.

GAUGING : Centre, with marking gauge, on all sides, from end to end, the 12-inch piece prepared in last lesson. Square off a line all around $\frac{1}{2}$ inch from end, then on that line point off $\frac{1}{2}$ inch on each side of centre on all four sides; from the points thus obtained draw lines obliquely to the corners at the other end; then draw lines from the said points on the line squared off to the centre of the top.

BEVELLING AND CHAMFERING : Bevel with draw knife and plane true, using bevel to prove the work. Chamfer the top to a point, as marked out.

Lesson XI.

DOWELLING : Draw a line through the centre of the base of the column made in the last lesson; point off $\frac{1}{2}$ inch on each side of centre. Make centres with scratch awl to bore from, and bore holes perpendicularly 1 inch deep with $\frac{1}{2}$ -inch twist bit. Glue in $\frac{1}{2}$ -inch dowels, ends to project $\frac{1}{2}$ inch. Centre the piece 4 inches square prepared in Lesson IX. Measure $\frac{1}{2}$ inch on each side; bore perpendicularly holes $\frac{1}{2}$ inch deep. Set gauge $\frac{1}{2}$ inch and gauge round the top and sides; chamfer off, using 1-inch firmer chisel; true up with block plane and try square. Glue together, making column and plinth.

Lesson XII.

DRAW-KNIFE AND PLANING TO LINE : Saw from stock strip 12 inches long, 2 inches square. Square up sides and ends. Gauge off $\frac{1}{2}$ inch from all the corners; put in bench vise; take off corners with draw-knife, and plane to line.

Lesson XIII.

MORTISING : Saw from stock two pieces 12 inches long, $1\frac{1}{2}$ inches wide, $\frac{7}{8}$ inch thick for stiles, and two pieces 8 inches long, $1\frac{1}{2}$ inches wide, $\frac{7}{8}$ inch thick for rails. Square them up. Form mortise in stiles and saw tenon in rails; mortise to be two-thirds the thickness of the stile, rails to enter stiles $\frac{1}{2}$ inch from the end, and tenons to project $\frac{1}{2}$ inch.

Lesson XIV.

MORTISING (completed) : Finish up and fit mortise and tenon, commenced in last lesson, with chisel; round the ends of tenons; drive together, and plane off back and front.

Lesson XV.

GLUE JOINT : Saw from stock two pieces 3 feet long, 3 inches wide, $\frac{7}{8}$ inch thick; plane the edges square, with jack plane, trying plane, and try square; joint together.

Lesson XVI.

BEVELLING : Saw from stock two pieces 3 feet long, 3 inches wide, $\frac{7}{8}$ inch thick; square them up; mark on edge with bevel (set to templet 45°), and plane to bevel with jack plane, fore plane, and trying plane.

Lesson XVII.

BLIND OR MITRE MORTISE : Saw from stock two pieces 6 inches long, 2 inches wide, $\frac{7}{8}$ inch thick; square them up; make mitre mortise and tenon, using try square, scratch awl, mortise gauge, back saw, $\frac{1}{2}$ -inch mortise chisel, and bevel; put the mortised piece in mitre board and plane true.

Lesson XVIII.

BLIND OR MITRE MORTISE (completed) : Drive together the pieces made in last lesson; level off faces and ends with block plane; round the ends to finish.

Lesson XIX.

MITRING : Saw from stock strip 18 inches long, 3 inches wide, $\frac{7}{8}$ inch thick; smooth it up and square it; cut into four pieces 4 inches long; mark corners of each piece on flat side with scratch awl and bevel (set to templet 45°); put in mitre box and saw to line; put in mitre board and true up; fit together and test with try square.

Lesson XX.

MITREING (completed): Glue together the pieces made in the last lesson, and key it, making a frame.

DOVETAIL: Saw from stock two pieces 4 inches long, 3 inches wide, $\frac{1}{4}$ inch thick; square them up; mark for dovetail and saw out.

Lesson XXI.

DOVETAIL (completed): Chisel out and fit the pieces made in last lesson; drive them together and level off with block plane; round the ends.

Lesson XXII.

FRAMING AND WEDGING: Saw from stock one piece 6 inches long, $1\frac{1}{2}$ inches square, and one piece 4 inches long, $1\frac{1}{2}$ inches square; square them up; form mortice $\frac{1}{2}$ inch \times $1\frac{1}{2}$ inches in long piece, using mortice gauge and $\frac{3}{4}$ -inch mortice chisel; form tenon, on short piece, to fit mortice, and to project one inch; cut hole in tenon, bevelled on one side, for wedge, using $\frac{1}{2}$ -inch chisel; drive together and wedge.

Lesson XXIII.

SQUARING TO SIZE: Saw strip $1\frac{1}{2}$ inches wide from $1\frac{1}{2}$ -inch plank; gauge to size; plane with jack plane, and true up with jointer and try square.

Lesson XIV.

PLANING TO WIDTH: Take $\frac{1}{2}$ -inch board about 6 feet long, 8 or 10 inches wide, and saw off strip $4\frac{1}{2}$ inches wide; plane with joiner to $4\frac{1}{2}$ inches; saw off two pieces 8 inches long for sides, and two pieces $4\frac{1}{2}$ inches long for ends of a box; square edges and smooth faces with plane.

Lesson XV.

DOVETAIL: Set single gauge to $\frac{1}{8}$ inch, and square around the ends of pieces prepared in last lesson; mark for dovetails; form dovetails, using $\frac{1}{2}$ -inch and $\frac{1}{4}$ -inch chisel, and cutting from both sides.

Lesson XXVI.

DOVETAIL (completed): Finish up and fit dovetails; glue together and clamp with hand screws, taking care to bring the joints up, and to keep the box square, using try square at every corner.

Lesson XXVII.

SMOOTHING AND SAND-PAPERING: Saw out two pieces $5\frac{1}{2}$ inches \times 9 inches, for top and bottom of box; square up edges and smooth faces; smooth sides and ends of box with block plane; sand-paper clean, and smooth; level off top and bottom edges.

Lesson XXVIII.

NAILING: Nail on top and bottom pieces, with $1\frac{1}{2}$ -inch No. 16 wire nails, being careful to drive the nails straight and in the centre of thickness of sides and ends.

MOULDING: Get piece 40 inches long, $\frac{1}{4}$ inch square, from stock; square to $\frac{1}{2}$ inch, and quarter round with jack plane, making a moulding for bottom of box; get from stock piece 40 inches long, $\frac{1}{2}$ inch square; square to $\frac{3}{4}$ inch, and quarter round, making a moulding for top of box.

Lesson XXIX.

MITREING: Saw moulding, made in last lesson, in lengths to fit box (mitreing the corners in mitre box), and glue them on the box.

Lesson XXX.

BEVELLING: Plane the edges of the top and bottom of box with block plane, to an equal projection all around; mark the top, with single gauge, 1 inch on, and $\frac{1}{2}$ inch down; bevel with $1\frac{1}{2}$ -inch chisel and finish with block plane, and sand-paper block.

Lesson XXXI.

CHISELLING: Cut a hole exactly in centre of top, $1\frac{1}{2}$ inches long, $\frac{1}{4}$ inch wide, using $\frac{1}{2}$ -inch chisel.

Lesson XXXII.

Finish up the box, with mouldings, etc., according to individual fancy.

SLOYD.

The method and means of Sloyd instruction¹ are grouped under—

A. *General principles.*—Attendance at Sloyd instruction should be voluntary on the part of the pupils. In order to do this the work must fulfil the following conditions: (1) It must be useful; (2) it must not require fatiguing preparatory exercises in the use of the various tools; (3) it must afford variety; (4) it must be capable of being carried out by the pupils themselves; (5) it must be real work, not play; (6) it must not be so called knick-knacks, that is, articles of luxury; (7) it must become the property of the pupil; (8) it must correspond with the capabilities of the pupils; (9) it must be of a nature that it can be completed with exactness; (10) it must admit of neatness and cleanliness; (11) it must exercise the thinking powers and not be purely mechanical; (12) it must strengthen and develop the bodily powers; (13) it must assist in developing the sense of form; (14) it must allow of the use of numerous manipulations and various tools.

B. *The teacher.*—(1) The instruction must be given by a trained teacher, if possible by the same teacher who instructs in intellectual subjects; (2) the teacher should conduct, superintend, and control the work, but guarding against directly putting his hand to it.

¹ Pamphlet issued in English by the normal school for Sloyd instruction at Näås, Sweden, and republished by the New York Industrial Education Association.

C. *The age of the pupil.*—In order to follow with advantage the course of instruction the pupil ought to have reached that stage of development usually attained at the age of eleven.

D. *Branches of instruction.*—The simultaneous employment of several different kinds of Sloyd acts detrimentally for the following reasons: (1) A sufficient number of subjects are already taught in the school, and every branch of Sloyd is a subject in itself; (2) the time to be devoted to this work is short and limited; (3) by different kinds of work the interest of the pupils would be easily diverted.

For the above mentioned standard of age, wood, Sloyd is the most suitable. It includes carpentry, turning, and wood-carving. Sloyd carpentry differs from trade carpentry in the following respects: (1) As to the character of the objects made in general, the objects are smaller; (2) the tools which are used, for instance the knife, which is the most important tool in wood Sloyd; (3) the method of working, in trade carpentry there is division of labor, in Sloyd none whatever. Turnery may be taken as a different branch of instruction, and as such be quite well separated from wood Sloyd.

E. *The number of pupils.*—Individual instruction is generally advisable. This is especially the case with Sloyd, which on fundamental and practical grounds cannot be taught as a class subject; therefore the number of pupils taught by one teacher must be limited.

F. *The models.*—In order to make the instruction as instructive as possible, models ought to be used in preference to drawings. The form should be sketched either directly by placing the model on the piece of wood, or by means of a diagram drawn with a ruler and compass on the wood. The models are to be simple, adapted to reproduction in wood both hard and soft, turned and carved are to be used as much as possible, capable of developing the sense of form and beauty, and so arranged as to teach the use of the necessary tools, and to know and to carry out all the most important manipulations connected with wood, in a series increasing in difficulty of execution, exactitude being demanded, not approximations to the correct form.

The Swedish course is well shown by the description of an English school¹ under an imported Swedish teacher. The class numbered twelve, among whom were two principals of boys' schools, a lady principal of a training college for female teachers, and a young lady who had won honors in Greek at Cambridge.

"The indispensable tool used by the sleight worker is the knife. The Swedish knife has a blade two and one-half inches long, immovably fixed in the handle, and terminating in a long, sharp point. Besides the knife each worker has a pencil, a square, a saw, an awl, perhaps a pair of dividers, and hammer and nails. For general use there are work-benches of Swedish pattern, but not much unlike those used in our best cabinet shops. Besides there are sets of bits, chisels, gouges, and planes. One work-bench and one set of tools suffice for four scholars. The following is a full list of the articles which are to be made by scholars as a result of a course of sleight training:

- | | | |
|---|-------------------------|---------------------|
| 1. Pointer. | 12. Ruler. | 24. Corner bracket. |
| 2. Flower stick. | 13. Knife-handle. | 25. Nail box. |
| 3. Penholder. | 14. Pen-tray. | 26. Sugar scoop. |
| 4. Bird's perch. | 15. First spoon. | 27. Boot-jack. |
| 5. Flower stick (square). | 16. Hammer handle. | 28. Shoe-brush box. |
| 6. Key-label. | 17. Second spoon. | 29. Stool. |
| 7. Slate-pencil holder. | 18. Bracket. | 30. Knife box. |
| 8. Dibbler (pointed stick for setting out flowers). | 19. Stocking stretcher. | 31. Salt box. |
| 9. Forked clothes-pins. | 20. Trencher. | 32. Teapot stand. |
| 10. Paper knife. | 21. Flower stand. | 33. Match box. |
| 11. Flower cross. | 22. Butter beater. | |
| | 23. Footstool. | |

"These articles are carefully arranged in the above list in the order of their difficulty, and each article is made in a manner and by steps definitely prescribed by the teacher. So simple are the first tasks, and so exact the method, that it is not possible for one who follows it to fall short of a certain standard of excellence. The wood used is at first a soft wood like white pine; afterwards a harder wood is employed. Each worker keeps in his own drawer every article made by him or her, marking each with his own name, and receiving all at the end of the course for permanent preservation."

"The great merits of the system appear to be—(1) the moderate difficulty of the tasks proposed; (2) the methodical way in which pupils are instructed; (3) the position, subordinate to the intellectual portion of school work, in which the training is firmly held. The fact that the progress is methodical does not imply that the rate of progress

¹ Leaflet 15 of the New York Industrial Education Association.

is the same for all. Tasks must be done in the same way by all, but each pupil may do as much and go forward as rapidly as his ability permits him. It is a capital merit of the system that it does not profess to confer upon the pupil any handicraft by which he can earn money, but it is strictly disciplinary in its character. The articles which the pupil has made, at the end of his course of study have little market value. They are simple wood utensils, characteristic of a period somewhat prior to the present age of machine products. The articles are not ornaments and would not have money value as such. Hence the learner does not become in any sense a competitor of the mechanic or artisan; but the fact that he has learned to produce good work gives him an interest in all good work by whatever hand produced. This not only qualifies him intelligently to judge of all mechanical work, but gives him that sympathy with the mechanic of which many persons, to their great loss, know nothing."

SEWING.

Instruction in sewing appears to have been introduced in Boston as early as 1835. The teachers of the two lower classes of the grammar schools were authorized to teach plain sewing one hour in the afternoon of 4 days of each week. In 1855 the new regulations provided that instruction in sewing should be given, and that special teachers should be appointed who should give two lessons of one hour each every week; and in the following year sewing was taught in all the grammar schools but one. In 1870 sewing was made obligatory in every girl's school, though not in the three upper classes. In 1873 the subject was made obligatory on all classes of the Winthrop School.

In the Report preceding this the subject is thus spoken of:

"Sewing would appear to be excellently fitted for introduction into the school course, since from its nature the students are not required to leave the class-room while under instruction; and although the superintendents of the evening schools of Brooklyn N.Y., advocate the congregation of those who desire instruction into a class, their recommendation is based on the complaint of individual scholars of the evening schools that they were being retarded in other studies by the time consumed in sewing, and not upon any fundamental difficulty of teaching the art in the ordinary school-room.

"At Boston, where the study has been most thoroughly introduced and organized, even to the extent of holding weekly meetings of the sewing teachers for conference, the course of instruction is, in brief, as follows: After the child has been taught how to select both thread and needle, to thread the needle and to hold it, it is put to basting together a "bag-apron," in which to keep the work; then it is taught to back-stitch, to hem, and to overcast the seams of the basted apron. This method has the advantage, says the supervisor of sewing, of interesting the child, since it is employed in making something that it is to wear. The material is almost invariably furnished by the pupil; the garment is prepared by the teacher and sewed under her direction. Great interest is manifested at the homes of the children, and cases are known in which the child has instructed the mother in the lesson that it has learned at school. In a few schools dressmaking has been introduced; simple dresses, however, are made in all the schools. In concluding her remarks the supervisor says:

"There is no doubt that the habits formed in connection with learning to sew have an important influence on the life and character of the girls and of their homes. It may be confidently asserted that the influence of the sewing is healthful and lasting upon the mind and character of the pupils, and on that account, no less than for its material utility, it deserves the respect and encouragement of the community. As a department of school work it is second to none in the success which it has attained, and the interest it has enlisted in and out of the school-room."

Mr. Philbrick, under whom as city superintendent sewing made such strides in Boston, says, in treating of the subject in a publication of this Office:¹

"The most important practical conclusions arrived at by the writer are formulated in the following propositions:

"(1) No girl can be properly educated who cannot sew. It would be a waste of time to demonstrate the importance of this part of a girl's education.

"(2) If this education were left to the homes it would be imperfect or wholly neglected, especially in the homes where it would be of the greatest practical utility.

"(3) That sewing should be an obligatory branch of instruction in all elementary public schools where girls are taught is both desirable and practicable.

¹ Monsieur B. Buisson, in his report to the French minister of public instruction on the late educational exhibit at New Orleans, says: "It is surprising that America should be so behindhand in adopting sewing as a public school study. The only sewing exhibit by an elementary school worthy of comparison with the good schools of Europe came from Boston." * * * But it is in Boston especially after the advent as superintendent of Mr. Philbrick, who had visited many European schools, that instruction in sewing has been thoroughly organized."

In Belgium, France, Germany, Austria, Switzerland, Italy, Portugal, Sweden, Norway, Denmark, Netherlands, and in England sewing has been introduced to a greater or less extent.

"(4) The instruction should begin with girls when about eight years of age and continue throughout the elementary course, from one to three hours a week being given to the lessons.

"(5) The course of instruction should be graded, beginning with plain sewing and mending and advancing to cutting and fitting.

"(6) The regular teachers might give the instruction in the lower grades, the employment of special teachers being limited to the upper classes.

"(7) Ability to teach sewing ought to be reckoned among the essential qualifications of a teacher of girls in the lower classes of elementary schools.

"(8) In large cities regional classes should be established, after the plan in Paris, for instructing in advanced needlework girls who have graduated from the elementary schools and others qualified for admission.

"(9) In cities of the first magnitude, and perhaps those of the second also, the system of instruction in sewing should culminate in a central school for teaching the most advanced stages of practical needlework, including dressmaking and millinery.

SEWING COURSE OF THE SPRINGFIELD (MASS.) SCHOOLS.

Grade IV.—First term: Fold, baste, back-stitch, overcast, fold, and hem (make narrow hem). Second term: Wide hem, sew salvage over and over, sew folded cloth over and over, stitch, make a bag. Third term: Review previous work; make a pillow-slip.

Grade V.—First term: Gather, lay gathers, baste gathers, baste gathers on to band, make an apron. Second term: Stitch a seam, fold, fell, cut-stitch, cross-stitch, feather-stitch. Third term: Darning, patching, sew on buttons, cut a straight piece and join, cut a bias piece and join.

Grade VI.—First term: Button-hole stitch, cutting button-hole, overcast, bar and work. Second term: Cut patterns, put on cloth, mark and cut. Third term: Cut by pattern.

COOKING.

The cooking school first appeared in 1874 in New York City, instruction being given to poor women and girls at an institution supported by one of the many charitable organizations of that city. Soon after, 1874 or 1875, a school was opened in Boston, and early in 1879 benevolent ladies of the school and of the Women's Educational Association opened a cooking school for the mission-school children similar to that in New York. Two classes were taught every day in the week, and every alternate Saturday a lecture was given. In a letter to this office in 1879 the lady chairman of the industrial committee of the Young Women's Christian Association of Boston says:

"We need a *free* cooking school after this method; we need also some preparatory work done in the public schools—simple talks to girls on all home matters. * * * Only one hour twice a week is allowed to each room [of the Winthrop School, of Boston] for learning to sew. * * * I think that the same time might also be again advantageously taken for elementary lessons in housework, and without disadvantage to 'analysis' and 'perspective.'" It is evident that this lady did not believe in any intrinsic relation between drawing and cooking—representation and construction.

It is claimed by the committee on manual training schools that the school known as the Boston School Kitchen No. 1, established in 1885, and supported by Mrs. Hemenway, was the first public school of its kind. The investigation of the New York committee on manual training showed that cooking had only been introduced at Boston and Toledo.

It is extremely supposable that on first sight the connection of cooking with mental development would not be appreciated, or at least its influence only recognized as indirect. General Walker, in an article read to the National Educational Association in 1887, speaks very positively on this subject, remarking: "But we are not driven to defend the introduction of cooking into the public schools as an invasion of the proper field of education, justified by due necessity. No one can spend an hour in the cooking schools of Boston * * * without being impressed by the very high education value of the instruction given. As a great object lesson in chemistry; as a means of promoting care, patience, and forethought; as a study of cause and effect; as a medium of conveying useful information, irrespective altogether of the practical value of the art acquired; the short course which alone the means at command allowed to be given to each class of girls has constituted, I do not doubt, the best body of purely educational training which any girl of all those classes ever experienced within the same number of hours."

COURSE IN COOKING OF THE WASHINGTON (D. C.) SCHOOLS.

First Year (Seventh Grade).

BOILING: A.—Talk about cooking, to discover what it is, how it affects food-materials, and what is needful for cooking; heat, natural and artificial; fuel, wood, charcoal, coal, gas; give directions for making a fire and make one.

Teach boiling by means of experiments: (a) Heat a cup of water, noting the change in temperature from time to time; note simmering and boiling. (b) Compare, by boiling, fresh and salt water with respect to density; experiment with eggs and blocks of wood; discover that it takes longer to boil salt water than it does to boil fresh water. (c) Put a piece of fresh meat into boiling water for a short time; note the result to meat and water; cut the meat and note the result; show the effect to meat and water of cold water on meat (this requires some time); cut the meat and note the result; boil the water. (d) Break an egg into boiling water and another into cold water; note the results; boil the cold water with the egg; draw inferences; hot water hardens albumen; to retain the nutriment in the article boiled put the article into boiling water and boil; to have nutriment mix with the water put the article into cold water and boil. (e) Make beef tea; have the meat prepared for the first class, after which let each class prepare meat for the succeeding one.

Boil meat to prepare the same for food. Boil meat for broth. Make jellied soup stock. Teach which parts of meat (beef, mutton, and lamb) are used for soups. Show economy of making stock. Teach the pupils how to distinguish between fresh and stale meats (appearance, smell, etc.).—Poach eggs.

B.—Experiment with salted and smoked meats: Put salted meat into cold water; then show that the water is salty by tasting it and by testing its density. Whence comes the salt? what it is, where found, how prepared for market.

C.—Experiment with starch and flour: (a) Cut a potato into thin slices and soak it in cold water. Pour off the water; show that starch is a fine powder found in grains and vegetables; show starch cells in potato; microscope. (b) Pour cold water over some starch, mix, and let it stand for a short time; stir again and pour on boiling water; stir and note the result. (c) Pour boiling water over dry starch; stir and note the result. (d) Make like experiments with flour; draw conclusions. (e) Dip a potato into boiling water; note the result. (f) Pour boiling water over oatmeal; note the result; draw conclusion.

Make blancmange. Cornstarch; from what and how obtained, how prepared, substitutes. Make a roux; plain, egg, and caper sauces. Boil rice and potatoes and mash; boil beets, onions, and squash. Give directions for preparing and cooking other vegetables. Make either vegetable soup or celery purée. Boil oatmeal (cracked wheat, cerealine). Boil rice and make rice custard. Boil coffee and cocoa, steep tea. Coffee, cocoa, tea; from what and how obtained; properties and value of each.

D.—Utensils used in boiling. An intelligent study of the materials from which the utensils are made.

STEWING: Experiment with tough meat and vegetable acids, such as lemon-juice and vinegar. Compare tender and tough meat before and after soaking in the acid. Show where in the animal tough pieces of meat are found. Explain why they contain so much nutriment and show their value as food. Make a beef stew. Make an Irish stew without dumplings. Braise a calf's

First Year (Seventh Grade)—Continued.

STEWING—Continued.

heart or smother a piece of beef. Haricot mutton. Stew fruit (apples, prunes, etc.). Make "bubble and squeak." Pepper, butter, substitute, from what and how obtained; use and value in cooking.

BROILING.—Broil a steak (beef or veal): (a) Compare results obtained with those obtained by putting meat into boiling water. (b) Names and positions of best steaks: broil chops, mutton, lamb, or pork: (a) Positions of chops. (b) Lard and oleomargarine; from what and how made; use; value; how to select different kinds of meat by appearance; toast bread; utensils used in broiling.

BAKING.—Experiment with yeast, soda, cream of tartar, sour milk, and baking powder: (a) Mix soda and cream of tartar with cold water; show the presence of carbonic acid gas (lighted taper). (b) Pour water over baking powder; show the presence of gas. (c) Mix soda with sour milk; show the presence of gas and that the milk is sweet. (d) Mix baking powder or soda and cream of tartar with flour; moisten and make a dough; put one-half into a hot oven immediately; allow the other half to remain exposed to the air for a short time, then put it into the oven; note the difference; cause of difference; draw conclusions. (e) Make yeast; talk about the yeast plant or germ; from what and how obtained; proper temperature necessary to the growth; what is caused by the growing? Fermentation; microscope; show presence of carbonic acid gas in yeast; mix yeast with a little flour and note the result.

Make white bread and rolls with potato yeast: (a) Kneading, length of time, motion, etc. (b) Compressed yeast. (c) Flour; from what and how obtained; kinds; properties and value of each; processes; make biscuits (baking powder); make muffins (soda and cream of tartar); make cornbread (soda and sour milk); make Graham gems.

Roast meat: (a) Compare the appearance of roast meat with boiled meat. (b) Best pieces for roasting. (c) Basting. (d) Solid and rolled roasts. Give, incidentally, the arrangement of oven dampers; kind of fire necessary for baking; and proper temperature of the oven.

Second Year (Eighth Grade).

BOILING: Review facts learned about boiling and obtain a definition. Boil mutton: (a) for the broth, (b) for the meat; make caper sauce. Boil fish; make egg sauce (Note.—Give directions for selecting and cleaning fish). Raising, slaughtering of animals, and packing of meat; means of preserving; principal cities for this industry; markets. Boil corned beef and cabbage; boil cauliflower; make egg sauce; make apple dumplings and sugar sauce; make roly poly pudding and sauce; make soft custard; make salad dressing; make potato salad.

STEWING: Oysters: (a) stewed, (b) scalloped; chowder; make a fricassee of beef or stew beef with carrots; make a white stew and a pot-pie.

BROILING: Broil a shad, a herring, or any other fresh fish. Broil a salted mackerel or any other salted fish. Broil a smoked fish. Broil a slice of ham. Broil oysters.

BAKING.—Review facts learned about carbonic acid gas, fermentation, and heat for baking; make white bread, Graham bread, and brown bread; stuff and bake a fish.

Make cake: (a) Cookies: Spices; from where and how obtained; their properties and use in cooking. (b) Ginger snaps. (c) Dover cake (Note.—Citron; from what and how made). (d) Sponge cake. (e) Jelly cake.

*Second Year (Eighth Grade)—Continued.***BAKING—Continued.**

Make pies: (a) Pie paste, (b) Apple pie (peach, rhubarb, etc.), (c) Lemon pie (custard, etc.). Make puddings: (a) bread, (b) Cottage pudding, (c) Sago, rice, or tapioca; Sago, tapioca, rice; from what and how obtained; how prepared for market; bake apples and potatoes.

Frying.—Experiment with fat: (a) Show that pure fat will not boil. (b) Show that fat containing water boils. (c) Show the proper temperature of fat for cooking by putting pieces of dough or a little of beaten egg into it at different times (before it is hot enough, when hot enough, and when burning); note the difference and draw conclusions. Show the economy in the use of eggs in kettle-fry-

*Second Year (Eighth Grade)—Continued.***Frying—Continued.**

ing; scramble eggs; make an omelet; make griddle cakes; make fritters. (a) Batter. (b) Salsify, parsnip, corn, etc. (c) Apple, oyster, clam, etc.; make doughnuts (raised by yeast); make crullers (raised by baking powder).

Third Year (High School).

(The third year's course in cooking has not been fully developed, as it will not be needed this year, but when developed it will include the preparation of more difficult dishes than those before given; the preparation of fancy dishes; the preparation of dishes for invalids; and the preserving of meats, vegetables, and fruits.)

MANUAL TRAINING COURSE OF STUDY FOR NEW YORK CITY.

This is not the place to discuss the great changes that are being made in the growth called the public school curriculum. In Boston the attack is upon arithmetic alone, we believe, but in New York it is somewhat in the nature of a thorough renovation.

So desirable is it to show the proportion of the programme that manual training occupies, "the co-ordination with the other studies of the system," as we ventured to call our meagre information on the subject in our last report, that we give the course of the New York schools in which manual training has been introduced, in full. We regret that we can only give the manual training course of the Paris schools to compare with the full course of the schools of our metropolis.

As a book of travels is much more understandable when illustrated, so have we illustrated each of the subjects of a manual training course by a curriculum particularly adapted for the purpose; now the view will be panoramic.

PRIMARY SCHOOLS.**SIXTH GRADE.**

1. *Language Lessons.*—Reading—familiar words, phrases, and simple sentences (from blackboard, charts, etc.); spelling—familiar words from dictation; lessons on the obvious parts and common uses of familiar objects; also on common colors.
2. *Form and Drawing.*—Form—sphere, cube, square, oblong; position of straight lines—vertical, horizontal, oblique; angles—right, acute, obtuse; surface, face, edge. Drawing—straight lines—vertical, horizontal, oblique; letters composed of straight lines; angles—right, acute, obtuse; representing (with straight lines) positions of strings, sticks, and edges; square and oblong faces of solids; squares and oblongs, from stick-laying.
3. *Writing.*—Short words (from copies on blackboard or chart).
4. *Number.*—Counting—by ones to 100, by twos and threes to 30; also counting backward by ones from 10; Adding—by ones, twos, and threes mingled to 20; numbers—to be read to 100 and written to 30.
5. *Vocal Music.*—Simple exercises in singing to train the pupils in the use of musical sounds

FIFTH GRADE.

1. *Language Lessons.*—Reading—from the blackboards, charts, and a First Reader; the meaning of phrases and selected words to be associated with their use in the sentences read. Spelling—words selected from the reading lessons; also other familiar words. Lessons on the obvious parts and uses of familiar objects, and on common colors continued.
2. *Form and Drawing.*—Form—cylinder, square, prism, hemisphere, circle, semicircle, triangle, curved surface, curved face, curved edge, curved line; measured lengths (inches). Drawing—angles—right, acute, obtuse; triangles; square and oblong faces of solids; curved and straight lines combined; circles and semicircles by free-hand movement; divide lines into equal parts; draw inch lengths.
3. *Writing.*—Short words (from copy).

FIFTH GRADE—Continued.

4. *Number.*—Counting by 3's, 4's, and 5's to 50. Adding by 2's, 3's, 4's, and 5's to 30 (on the blackboard and the slate). Subtracting by splints, etc., from numbers below 20. Multiplying two by the numbers below six. Numbers to be read at sight from the blackboard, and to be written through three places. Roman numbers through XII, also their use on the clock face.
5. *Vocal Music.*—Continued as in the sixth grade with two or three simple songs, and the scale by rote. Represent steps of scale and give simple ideas of time.

FOURTH GRADE.

1. *Language Lessons.*—Reading—through a First Reader, or in an easy Second Reader. The meaning of phrases and selected words from the sentences which have been read. Spelling—words selected from the reading lessons, and other familiar words. Lessons on familiar objects continued, with obvious qualities added, also on color.
2. *Form and Drawing.*—Form—triangular prism, rhomb, rhomboid, right, acute, and obtuse angled triangles; faces—plane, curved; circle—circumference, diameter; square—diameter, diagonal. Drawing—square, rhomb, oblong, rhomboid; three kinds of triangles; squares drawn in group to represent surface of a cube; oblongs and squares in group, to represent surface of a square prism; circle with diameter; squares with diameters and diagonals; parallel lines; front and end of square and of oblong boxes; groups of circles.
3. *Writing.*—Short sentences (from copy).
4. *Arithmetic.*—Numeration and notation—through six places. Adding single columns of seven figures, including 6, 7, 8, and 9, also orally by 6's, 7's, 8's, 9's, and 10's. Subtracting 3's, 4's, 5's, and 6's from numbers below 20. Multiplying two by numbers below 11. Simple practical questions. Roman numbers to include L.
5. *Vocal Music.*—Instruction as in fifth grade continued, with additional songs by rote.

THIRD GRADE.

1. *Language Lessons*.—Reading—in a Second Reader; the meaning of phrases and selected words which have been read. Spelling—words selected from reading lessons, and other familiar words (orally and in writing); lessons on familiar objects continued.
2. *Form and Drawing*.—Form—cone—base, vertex; pyramid—square, triangular; equilateral triangle; squares on diameters, on diagonals; concentric squares. Drawing—cylinder, cone, oblong, triangle with two equal sides; faces of a solid, in group; circles—diameters; parallel lines; squares on diameters and on diagonals—add curved lines symmetrically arranged; two adjacent faces of a solid; common objects—window, door; groups of tablets.
3. *Writing*—sentences continued. Short words without capitals.
4. *Sewing*.—Threading of needle; use of thimble; overhanding.
5. *Arithmetic*.—Addition—three columns of ten figures (including examples with concrete numbers); simple, practical questions in addition and subtraction (to be worked without slate and pencil); multiplication table—through 6 times 12; Roman numbers to include D.
6. *Vocal Music*.—Instruction continued, with the use of staff, clef, notes of different length, time, etc.

SECOND GRADE.

1. *Language Lessons*.—Reading—through the Second Reader; the meaning of phrases and selected words which have been read. Spelling—as in the previous grade; lessons on familiar objects continued.
2. *Form and Drawing*.—Form—ellipsoid, ovoid, vase; ellipse, oval; quadrant, radius, arc; octagon, hexagon, pentagon. Drawing—ellipse, oval; vase form, reversed curve; quadrant, radius, arc; octagon, hexagon, pentagon; crosses—Latin, Greek, Maltese, St. Andrew's; circles on half diameters and half diagonals of squares; objects—pitcher, teapot, etc.; ornamental group of tablets.
3. *Writing*.—Sentences continued with all the capitals.
4. *Sewing*.—Hemming; seam-sewing; overcasting.

GRAMMAR SCHOOLS.

EIGHT GRADE.

1. *Language Lessons*.—Reading, of the grade of a Third Reader; oral lessons on the qualities and uses of familiar objects, such as articles of clothing, food, material for building, etc.; compositions; spelling, meaning, and use of words, chiefly from the lessons of the reading-book and from the oral lessons of the grade; also selected miscellaneous words in general use, at least 100 in number, to be taught chiefly by writing them separately, and in short sentences from dictation.
2. *Geography*.—The world, from globes and outline maps.
3. *Arithmetic*.—Through the simple rules and Federal money with practical examples; selected tables of weights and measures, with simple, practical applications.
4. *Penmanship*.—Words with capitals.
5. *Form and Drawing*.—Drawing—(free-hand)—semicircles; arrangement of simple and compound curves; simple historic borders; symmetrical arrangements of cordate leaves; simple objects from nature; maps. (Mechanical)—use of instruments; application of simple practical problems of geometry; patterns formed from intersecting parallel lines; surface patterns, hexagonal and octagonal; parallel lines as used for shading. Cutting and modelling from drawn work.
6. *Sewing*.—Review hems and bias fells, French seams; gathering.

SECOND GRADE—Continued.

5. *Arithmetic*.—Addition, subtraction, and multiplication (multipliers not to exceed 12), with practical examples; multiplication table completed; Roman numbers to number of the year. Tables—Federal money, time, liquid measure, and dry measure.
6. *Vocal Music*.—Instruction continued as in previous grade; singing notes in groups, pupils to beat time.

FIRST GRADE.

1. *Language Lessons*.—Reading—of the grade of an easy Third Reader; meaning of phrases and selected words which have been read. Spelling—as in previous grade. Lessons on objects as in the previous grades, with more complete descriptions.
2. *Geography*. Without text-books—points of compass; location and direction of familiar places; elementary terms; shape of earth and situation of principal bodies of land and water, on globe and on map.
3. *Form and Drawing*.—Form—construction of forms of regular solids by drawing, cutting, folding, and pasting paper, etc.; construction in clay from drawings—steps of stairs, slate frame, concentric squares, etc.; representation of islands, etc., with clay. Drawing—circular faces, seen directly and obliquely; objects—oil-can, ash-can, tea canister, street lamp, kite, etc.; tablets arranged as borders and other ornaments. Draw, as maps, the clay representation of islands, etc.
4. *Writing*.—Brief designs of familiar objects; words with capitals; during the latter half of this grade one lesson each week to be written from dictation.
5. *Sewing*.—Seams—back stitching and stitching; plain fells; bias fells.
6. *Arithmetic*.—Numeration and notation—through nine places; addition and subtraction continued; multiplication—multiplicand not exceeding 6 figures, multiplier not exceeding 4 figures. Division—divisor not exceeding 12; practical examples in the several rules. Tables—long measure, avoirdupois weight and miscellaneous table, with review of previous grade; simple, practical questions.
7. *Vocal Music*.—Instruction continued as in the second grade; teach the singing of simple tunes in the natural scale by numerals, syllables, letters, la la la, and by appropriate words.

SEVENTH GRADE.

1. *Language Lessons*.—Reading, of the grade of a Third Reader (a different book from that used in the eighth grade); oral lessons on animals; compositions; spelling, meaning, and use of words as before—at least 100 additional words and a review of those previously taught.
2. *Geography*.—Western Hemisphere in outline, together with review of preceding grade—without text-book.
3. *Arithmetic*.—Through subtraction of common fractions, with practical examples; selected tables of weights and measures, as before.
4. *Penmanship*.—Words and phrases.
5. *Form and Drawing*.—Drawing—(free hand)—circles; borders, two different units to be used in each; symmetrical arrangement of hastate leaves; simple objects, from nature; maps. (Mechanical)—applications of simple practical problems of geometry; straight lines, "dotted," etc., door with panels, and window with panes, from measurements made in class; running patterns from circles and arcs; trefoil in triangle. Cutting and modelling—from drawn work.
6. *Sewing*.—Button holes; sewing on buttons; patching.

SIXTH GRADE.

1. *Language Lessons*.—Reading, of the grade of an easy Fourth Reader; oral lessons on plants; compositions; spelling, meaning, and use of words as before—at least 100 additional words and review of all previously taught; easy exercises in suffixes.

SIXTH GRADE—Continued.

2. *Geography*.—Eastern Hemisphere in outline, together with review of preceding grade—without text-book.
3. *Arithmetic*.—Common fractions completed, with practical examples; selected tables of weights and measures, as before.
4. *Penmanship*.—Phrases and sentences.
5. *Form and Drawing*.—Drawing—(free-hand)—ellipses; ovals; vases; original designs with leaf and flower; simple objects, from nature; maps. (Mechanical)—applications of simple, practical problems of geometry; tables, etc., from measurements made in the class; arches, by arcs of circles; quatrefoil in circle; designs (ornate), circle and contents; window, pointed arch. Cutting and modelling—from drawn work.
6. *Sewing*.—Herringbone stitch, and flannel patching; darning stockings; darning tears and cuts.

FIFTH GRADE.

1. *Language Lessons*.—Reading, of the grade of a Fourth Reader; oral lessons on the human body; composition; spelling, meaning and use of words as before—at least 100 additional words, and review of all previously taught; exercises in prefixes and suffixes.
2. *History of the United States*.—A brief general outline—without text-book.
3. *Geography*.—Western Hemisphere in detail, with special attention to United States, together with review of preceding grade.
4. *Arithmetic*.—Decimals, with practical examples in common and decimal fractions; reduction, ascending, and descending, of integral denominate numbers.
5. *Penmanship*.—Phrases and sentences.
6. *Form and Drawing*.—Drawing—(free hand)—regular pentagon; Greek vase, with perspective effect; Egyptian and Greek borders; flowers and trilobate leaves in original designs; maps; elevations, plans, and other views of cubes, prisms, cylinders, and cones. (Mechanical)—simple graphic solutions of selected geometrical theorems; elevations, etc., already drawn free-hand; drawing required for shop work. Modelling—Relief maps. Shop-work—use of tools—knife, and jack plane; making joints—butt, butt-mitre, lap, etc.
7. *Sewing*.—Review all previous work; tucking, gussets.

FOURTH GRADE.

1. *Language Lessons*.—Reading, of the grade of a Fourth Reader (a different book from that of the fifth and sixth grades), and in supplementary reader upon the subjects of the oral lessons of this or previous grades; oral lessons on common minerals and metals; composition; spelling, meaning, and use of words, as before—at least one hundred additional words, and review of all previously taught; exercises in prefixes and suffixes continued. English grammar (without text-book)—the construction of sentences, with a view to develop a knowledge of the parts of speech, and to illustrate the terms "subject," "predicate," and "object."
2. *History of United States*.—Outline with greater detail—without text-book.
3. *Geography*.—Eastern Hemisphere in detail, with special attention to Europe, together with review of preceding grade.
4. *Arithmetic*.—Denominate numbers completed, with practical examples.
5. *Penmanship*.—Practice in large and small writing.
6. *Form and Drawing*.—Drawing—(free-hand)—the spiral; flowers and lobed leaves in original designs; mediæval and moresque ornaments; ornamented vases; maps; working sketches of tools and of joints; sections of solids. (Mechanical)—simple graphic solutions of selected geometrical theorems continued; working drawings for shop work. Modelling—relief maps. Shop work—use of tools—add crosscut saw, hammer and nails, and chisel; making joints, etc.
7. *Sewing*.—Measuring, cutting, paper patterns, and fitting.

THIRD GRADE.

1. *Language Lessons*.—Reading, in supplementary reader upon subjects of the oral lessons in this or previous grades; oral lessons on the simple facts of natural philosophy; composition; spelling, meaning and use of words as before; exercises in the formation of derivative words; English grammar (without text-book) continued.
2. *History of the United States*.—Through the Revolutionary War—class reading in text-book and in historical supplementary reader. No home lessons to be given.
3. *Geography*.—General review, with special attention to the United States and Europe. Supplementary readings in geography.
4. *Arithmetic*.—Percentage, its applications to ordinary business transactions which do not involve the consideration of time.
5. *Penmanship*.—Practice in difference styles; letter-writing.
6. *Form and Drawing*.—Drawing—(free-hand)—historic vase, decorated; original pottery form, decorated; historic ornaments; original surface covering, not less than two different units to be used; original circular border; maps; working sketches for shop work. (Mechanical)—simple graphic solutions of selected geometrical theorems, continued; working drawings for shop work. Modelling—relief maps; simple forms for carving. Shop work—use of tools—add gouge, rip-saw, center-bit, and hand-screws; cutting mouldings, etc.; making joints—lap, scarf, and mitre.
7. *Cooking*.—Materials of the human body; tissues—waste of, repair of. Digestibility—cooking solid materials to prepare them for digestion. Nutritiveness—nutritive values of foods; palatability. Food elements—groups of—mineral; starch and sugar; fats; albuminoids. Related facts—physical and chemical; kinds of fuel; effects of heat on water—boiling points; temperatures of flames; physical effects of heat on albumen; on starch; on gluten, etc.; proper temperatures for various purposes; chemical effects of overheating; principle and action of yeast powders, of leaven, of yeast; important function of the sugar in flour. Utensils—their selection, use, and preservation. Purchasing food—discrimination as to wholesome and unwholesome; choice of parts. The "germ theory"—applied to foods. Practical exercises in cooking, involving simple applications of facts and principles taught.

SECOND GRADE.

1. *Language Lessons*.—Reading—supplementary reading as before; oral lessons on the simple facts relating to air, water, light, heat, and sound; compositions, spelling, and meaning of words as before; exercises in the formation of derivative words continued. English grammar—the construction of compound and complex sentences, with the view of teaching propriety of expression.
2. *History of the United States*.—Completed, with very brief outline of the Federal, State, and municipal government. Instruction as in third grade.
3. *Arithmetic*.—Interest and discount; simple proportion.
4. *Penmanship*.—Paragraphs; business forms, such as bills, receipts, drafts, etc.; letter-writing continued.
5. *Form and Drawing*.—Drawing—(free-hand)—original designs for industrial purposes; from the model—cube, square prism, square pyramid, cylinder and cone; working sketches for shop work. (Mechanical)—working drawings for shop work. Modelling—simple forms for carving. Shop work—joints—dovetail, mortise.
6. *Cooking*.—As in third grade.

FIRST GRADE.

1. *Language Lessons*.—Reading, as before, together with poetry and fiction; compositions; spelling, meaning and use of words, as before; a review of the previous grades in the formation of words. English grammar continued.

FIRST GRADE—Continued.

2. *Arithmetic*.—A review of the business arithmetic of the preceding grades; also exchange, equation of payments, averaging of accounts, custom house business, partnership, and mensuration.
3. *Penmanship*.—Paragraphs, business forms, and letter-writing, continued.
4. *Plain Geometry*.—Fundamental theorems and problems.

FIRST GRADE—Continued.

5. *Form and Drawing*.—Drawing—(free-hand)—original designs for industrial purposes; historic ornaments; from the model—prisms, hexagonal and octagonal; also, groups of solids; working sketches for shop work. (Mechanical)—working drawings for shop work. Shop work—dovetailed box, from measurements and drawings.

COURSE OF THE PARIS PUBLIC SCHOOLS.¹

Some 555 public elementary schools in Paris educate over 120,000 children between the ages of six and twelve, at an annual cost of \$2,700,000. Below these are the kindergartens, 126 in all, attended by 30,000 children from six down to two years of age, at an annual cost of \$410,000. Above the elementary schools are the higher elementary schools, 7 in all, approximating our high schools as to grade, attended by 4,000 pupils over twelve and under fifteen when admitted, costing \$700,000 annually. Six hundred and ninety-two schools, attended by 155,000 pupils, costing annually \$3,810,000, exclusive of the cost of new buildings and repairs, about a million more. In 1830, two years before M. Guizot began the foundation of the public school system of France, the appropriation was not quite \$25,000. Ten per cent. of the city's expenditure, \$60,000,000, is for education, but this includes other schools than those given above.

The kindergartens, says Mr. Schoenhof, are more than a benefit to the working class—they are a blessing. The attendance averages from 150 to 200 for each school. In winter the hours are from 8 a. m. to 6 p. m., in summer from 7 until 7. At 11 o'clock the children get soup and eat whatever they may have brought with them. The manual exercises consist of plaiting, twining, folding, and knitting. Sewing would be fatiguing. Instruction is given in a way to create the impression that it is play. Thus from the very foundation the effort is begun "to educate the mind through the senses, and to lead the pupil well prepared into the great open field of industrial life, where the battle of life is fought."

In the elementary schools it is held (Mr. Schoenhof was in oral communication with the authorities) that physical education, manual labor practice, conduces better to the development of the mind than one-sided theoretical instruction. The former is introduced in support of the latter, and experience of some years has demonstrated to the satisfaction of competent observers the wisdom of combining manual labor exercises with theoretic instruction in primary schools.

In 90 of the 235 elementary schools for boys there are workshops for iron and wood work, under a superintendent. The lower classes make paper objects, card-board boxes covered with colored paper, and the like. Some schools have as yet only this instruction. The workmen instructors superintending the manual training classes receive about 30 cents an hour. A model school is that designated as "Primary [elementary] School 109, avenue Parmentier." It has a wood and an iron shop, the wood shop being the largest. There are in it twelve carpenter benches, in two rows in the middle of the room—each bench accommodating two boys—and four lathes against the wall. One boy turns for a quarter of an hour, two others observing him; then one of the observers exchanges place with him, and so on; there being three times as many boys as lathes as yet. At the bench the pupils are taught joining, dovetailing, etc.; at the lathe they commence on a plain stick of a certain length, "which is turned into 76 different ornamental pieces, made either to stand separately or to fit into others, and by combining produce a finished object." If they make ten pieces satisfactorily they are permitted to make something for themselves and take it to their home. The workshop for iron contains twelve vises, arranged along the walls, a boring machine, anvil, and forge. Starting with a plain piece it is worked into simple geometrical shapes and other forms by the file. Lead is used for forging and hammering, as it requires less strength to work than iron.

For the girls sewing has been introduced and, in the upper classes, household work. In the sewing classes the pupils bring their own materials. One and a quarter hours are devoted to the subject during the week in the lower classes, and a half hour more in the middle classes.

The French have what would be called in English, if the term were translated word for word, superior primary schools, but as the word primary in this connection covers what we mean by elementary, superior elementary schools are about equivalent to our high schools without the classical features; in brief, they have a literary course similar to

¹ The matter here given in abstract is based upon a report by Mr. Schoenhof, U. S. consul at Tunstall, England, to the Secretary of State, entitled "Industrial Education in France," published within the year.

that of our manual training schools as described in Table 77, and the remarks thereon. The term of instruction covers four years. The directors and professors are appointed by the minister of public instruction, who can establish the schools on the request of a superintendent of education of a department, acting at the motion of the civil authority of the department, or on the demand of the "committee of patronage." The instruction is gratuitous and, wherever practicable, pupils are boarded at their own expense. Scholarships of various kinds seem to be provided in considerable number. The shop practice, upon which the law lays great stress, is in wood and iron work. In the wood-working department sawing, boring, planing, and joinery are taught, and the qualities and usages of different woods and the principal tools explained. In the iron shop the work consists of filing, hammering, forging, soldering, graving, boring, turning, and fitting, and the instruction in explaining the properties, varieties, and uses of iron and the manner of using the different tools in working it. Rough sketches and working drawings are made of all objects to be executed by the pupil; in the higher classes the drawing resembles in some degree that given in industrial art schools.

Mr. Schoenhof says "there are now in Paris under the title *Écoles primaires supérieures* and subject to the municipal school system of Paris" seven schools, one of which, in the Rue de Jouy, is for girls. But as he has not described this school under the caption *Écoles primaires supérieures pour filles*, and states that the general course of instruction of those given under that head "is such as is required for higher employments—book-keepers and correspondents—for the industrial classes, to make the girls practical and intelligent workwomen, as well as to fit them to take charge of the industrial establishments of woman's employment," they may be viewed as practically trade schools.

The following is the programme worked out by the French school authorities for workshop practice in their so-called primary schools.

It is expected that this workshop practice will soon be extended to cover all the elementary schools of Paris—handwork, like that described above, in the boys' schools, and work serviceable for girls' occupations in after life in the girls' schools.

ELEMENTARY CLASS.

[Seven and eight years old. One hour per day.]

Elementary exercises in free-hand drawing, symmetrical arrangement of forms, cutting out pieces of colored paper and applying them upon geometrical forms, exercises in coloring, cutting out geometrical forms in cardboard, representations of geometrical solids. All these exercises to be done first on squared and subsequently on plain paper.

Small basket work. Arrangement of strips of colored paper: (1) In interwoven forms. (2) In plaited patterns.

Modelling: Reproductions of geometrical solids and simple objects.

INTERMEDIATE CLASS.

[Nine and ten years old. One hour per day.]

Cutting out cardboard patterns, construction of regular geometric solids, construction by the pupils of cardboard models, covered with colored drawings or colored paper.

Small basket work; combination of plaits; basket making.

Objects made of wire; trellis or netting; wire chain making.

Combination of iron and wood. Cages.

Modelling simple architectural ornaments.

Object lessons: Principal characteristics of wood and the common metals.

UPPER CLASS.

[Eleven and twelve years old. Two hours per day.]

Drawing and modelling; continuation of the exercises in the preceding class; repetition of the ornaments, previously executed, in the form of sketches, with dimensions attached to them; drawing the requisite sections for this purpose; reproducing the sections as measured sketches; study of the various tools used in working wood—hammer, mallet, chisel, gimlet, centre-bit, brace, screwdriver, compasses, square, marking-gauge, saws of different kinds, jack plane, trying plane, smoothing plane, files and rasps, level.

Theoretical and practical lessons in the above. Planing and sawing wood; construction of simple joints.

Boxes nailed together, or jointed without tacks. Wood lathe; tools used in turning; turning simple geometrical forms.

Study of the tools used in working iron—hammer, chisel, cutting tool, cold chisel, squares, compass, files, etc.

Theoretical and practical lessons concerning them.

Exercises in filing, smoothing, and finishing rough forgings or castings (cubes, polygonal nuts).

The practical work in the shops in primary schools is to be followed by gymnastic exercises, in accordance with a specialised programme.

PUBLIC MANUAL TRAINING (RUSSIAN SYSTEM) SCHOOLS.

These schools are treated of along with other schools of the class to which an entire section has been devoted. There are too few of them to attempt any division into public and private, and it has been deemed expedient to group them in one table, which is facile, inasmuch as they are based, with an exception, upon the Russian system.

While referring the reader to this section it is deemed proper to give a brief account of the origin and scope of the class, and in doing so, and for those not having the Bureau's report for 1886-87, the statement made in that report will be used:

"A decade has passed since Professor Runkle became acquainted with the system of instruction pursued at the Imperial Technical of Moscow, saw its utility, and advocated and secured its introduction into the Massachusetts Institute of Technology. Of the

several manual training schools or departments established since that important event, it will here suffice to mention three, which claim particular attention by reason of the sources from which they sprang.

"The St. Louis Manual Training School, though a department of the Washington University, owes its establishment in 1879¹ to the liberality and wisdom of several gentlemen of St. Louis, by whom the buildings were erected and the school endowed. To define the scope of this school and give its programme of manual studies is to give those of the other two of which it seems to have been the prototype. "Its object," says the second article of the ordinance given by the Washington University, "shall be instruction in mathematics, drawing, and the English branches of a high-school course, and instruction and practice in the use of tools. The tool instruction, as at present contemplated, shall include carpentry, wood-turning, pattern-making, iron chipping and filing, forge work, brazing and soldering, the use of machine tools, and such other instruction of a similar character as may be deemed advisable to add to the foregoing from time to time." In all the schools the course is of three years. At St. Louis and Chicago the first year is spent at wood-working, the second at the forge, and the third at the metal-working bench and lathe, and in the study of machinery. The sequence at the Baltimore school is somewhat different, forging coming the first, and pattern-making and vise-work in the second year. Mathematics through trigonometry, English language, literature, and history, and elementary science are relied on for mental training, and free-hand and mechanical drawing is the intermediary that brings the mental and manual work into relation. In all the schools the day is about equally divided between the two concurrent systems of development.

"The history of the Chicago Manual Training School began at a meeting of the Commercial Club of that city in 1882, during which funds were subscribed and a committee appointed. On April 19, 1883, the Chicago Manual Training Association was incorporated and the control of the school vested in a board of 9 trustees appointed by it. The school was opened in February, 1884, on completion of its building.

"But perhaps the most interesting example of the establishment of an institution of this class is the organization of the Baltimore Manual Training School as a part of the public school system of the city. On the 24th of April, 1883, in response to a motion, a committee was appointed by the school commissioners to report upon the best means of fitting boys and girls "as quickly as possible for self-support." On June 19, 1883, the committee reported that it would be expedient to establish a high school for manual education under the supervision of the board, since "a knowledge of some form of industrial labor is as necessary as a knowledge of books; and as the State and city acknowledge their obligations to teach children to read and write they cannot deny their obligation to teach them to work, as the latter is as essential for the public welfare as the former. Only a small portion of those who receive their education in the public schools ever enter the professions, but the large number become artisans and adopt mechanical occupations for their future support." On petition, the city council empowered the school commissioners to establish the school, and legislative action was taken in January, 1884. In March of the same year the school was opened."

III.—STATISTICS.

A—As A PUBLIC SCHOOL STUDY IN 1888.

Having placed before the reader in the preceding sections the theory upon which manual training is based and the means that it uses to accomplish its aims, it is now in order to treat of the condition of the subject for the year covered by this report. This section is that which will appear annually. Its methods are simple. In the first place, the statistics which it contains are obtained from inquiries sent to schools and system of schools known or supposed to have introduced manual training. In the second place, its text, with the exception of the remarks on the tables, is obtained as a rule from or based upon the discussions of the subject by educational authorities either at home or abroad. The Office cannot too much thank its correspondents for the care with which its inquiries have been answered and the intelligence exercised in filling its statistical forms.

¹ After the above was written, in 1887, information came ("The Manual Training School," by C. M. Woodward, p. 5) that "exercises for the sole purpose of tool instruction" had been introduced into the Polytechnic School of Washington University, of St. Louis, about 1874; that this school in 1877 had outgrown the single shop, and an old dwelling house was secured, the chambers being used for a carpenter shop, the parlors for a machine shop, and the basement for a forging shop. The shops were used for three years, with no essential change of plan.

Matters of this kind must, of course, be left to the historian of a movement. His is the province of exhaustive treatment which entails exhaustive research. It is needless to say that in this chapter neither has been attempted.

INTRODUCTION INTO THE SCHOOLS OF NEW YORK.

The principal event of the year, one is almost tempted to say the most important event in the history of manual training, is its introduction into the public schools of New York City. This action was in pursuance of the report of the committee on manual training, noticed in the foregoing sections and in the report that precedes this. The committee arrived at seven conclusions and delivered itself of nine resolutions.

The conclusions are:

1. That the introduction of manual training would be an improvement to the present course of study.
2. That manual training is admissible into the schools only as a means of general and not of special education. "The industries of this metropolis are too diverse, the sentiment of equality is too strong, the ambition to rise is too general to allow of any scheme that would designate certain pupils for particular walks of life. Rather must we seek, if we use new methods, to get by means of them better results of a general nature, better trained and disciplined minds, and greater aptitudes and powers for living and doing in whatever may be the pupils future career.
3. That, notwithstanding misdirected efforts in the past, there are certain manual operations which time and experience have sufficiently tested to demonstrate their usefulness and their availability. These operations have the following characteristics: They are such as to lead the people to acquire correct conceptions of form through the careful and systematic discipline of his sense perceptions, and to require, as a test of the accuracy of these conceptions, their correct manual embodiment in material; and, further, to give a practical knowledge of natural laws and of the qualities of materials. These are: Carpentry work, modelling in clay, construction work, paper and pasteboard work, drawing to a scale, sewing, cooking. These are adapted to the child, are useful, inexpensive, and will only require a moderate increase in the teaching force.
4. The training should be for all.
5. The work should not be interrupted by adopting the "central school-shop" feature. Each school building should have its own shop.
6. That the length of the session should not be increased. "The chief excisions will be made from the studies of geography, history, and arithmetic in all the grades" of the grammar schools in order to give room for the new studies. The introduction of kindergarten work into primary grades of course has been well canvassed.
7. That provision must be made for suspending the introduction of some of the proposed work in certain schools, as the carpentry work and cooking will require a separate room.

The resolutions ask for the introduction of manual training, that kindergarten occupations—splints, wire, paper, and clay work—be introduced into the primary grades; that drawing to a scale be introduced both into the boys' and the girls' grammar school; that the girls be taught sewing from the eighth to fourth grades, inclusive, and cooking in the third and second; that the boys be given work-shop instructions from the fifth to the first grades, inclusive; that the work-shop, cooking, and sewing instruction be taught by special teachers, and over all work of this kind in primary or grammar grades an assistant superintendent be appointed.

The board of education adopted these views, and directed the committee to report a course of study in conformity with its own conclusions, which, when approved by the superintendent, should become the course of study for the school selected for introducing the subject, the committee having the power, with the approval of the superintendent, of modifying it. The board also directed "that on application of any board of trustees to said committee to introduce such course into any school, the said committee may authorize the substitution in such school of the course of study and provisions prepared by them, in place of the usual course of study, and the proper committee shall authorize the expenditure necessary therefor, subject to the rules of the board relating to expenditures; provided that until further action is taken by this board, such course shall not be introduced into more than six male grammar schools and six female grammar schools, and the primary departments and schools connected with them."

In the absence of the report of the city superintendent for 1888 we are compelled either to depend on non-official information regarding the introduction of the study into six schools for boys and six for girls or to let the matter go over until our next report; we take the latter alternative. The statistics appear in the table.

For these twelve schools, however, an appropriation of fifteen thousand dollars was made, which was thought to be much too small.

STATE ACTION.

In accordance with the resolution passed May 19, 1887, the governor of Pennsylvania appointed a commission consisting of five to investigate the subject of "industrial education." A meeting was held in Harrisburg on December 9, 1887, and the following in-

quiries were referred to the several members for report at the meeting at Philadelphia, in January, 1888:

1. To what extent in its several grades and by what methods carried on outside of Pennsylvania?

2. To what extent and by what methods now carried on in the several grades of public schools of Pennsylvania, and the practicability of introducing or extending it in such schools—city and rural?

3. To what extent in its several grades and by what methods now carried on in private institutions in Pennsylvania, with the relation of such work to other forms of education, to public charities, reformatories, to industrial development, and to the general interest of society? The best method of enlarging and extending such work, having in view also the question of its more or less direct connection with public systems and agencies.

4. The best means and methods of establishing and maintaining in its several grades; whether by State action or by local action, or by both combined. How far it can be incorporated into the present public-school system in Pennsylvania; what, if any, changes of law are necessary or desirable to that end?

5. Best methods of training suitable teachers. Changes, if any, required for this purpose in the present system of normal schools; changes, if any, required to enable the normal schools to meet more fully the needs of the present public school system?

6. As to each of the foregoing topics: How far the educational element should be incorporated into such training, as distinguished from its strictly trade, apprentice, or technical element?

On May 19, 1888, the governor of New York approved the act (New Legislation, p. 134) empowering local school authorities to establish "industrial training" departments, and for teaching and illustrating the manual or industrial arts and the underlying principles. The State normal schools are required to include in their courses the principles underlying the manual or industrial arts, and also the practical training in the same.

From New Jersey we have been unable to obtain information.¹

OPINIONS OF CITY SUPERINTENDENTS AND OTHERS ON MANUAL TRAINING.

It is very evident that much diversity of opinion exists on what manual training is good for. An endeavor to collate the opinions on the subject would seem to be a hopeless task. We have endeavored to define manual training as a theory of education by examining arguments of several competent authorities, all issued within the year, but to put the matter completely before the reader and prevent any misunderstanding that may arise from his not knowing our "personal equation," as they say in astronomy, we present a symposium on the subject.

Los Angeles, Cal.—"I am heartily in sympathy with manual training in the common schools," says the superintendent, "so far as it can be done with kindergarten work. Beyond this it is difficult to determine how much or how little should be done. If there be as much need for training in iron, wood, leather, brass, cloth, cooking, etc., as the ardent advocates of manual training would have the country believe, why do not private enterprise and capital engage in the work as they do in law, medical, and commercial schools?"

The principal of the high school, however, advocates the introduction of manual training into that school, and as the training has a distinctive character of its own, and is not adapted to the work of the school-room, he would organize a manual training department somewhat on the plan of the Baltimore and Philadelphia schools.

New Haven, Conn.—"Much has been said and written of late," says the superintendent, "on the wisdom of leavening public education with certain forms of industrial training. As the value of this departure is to be determined by actual experiment rather than by actual argument, it is only necessary here to state what has been attempted the past year." The characteristics of the course are given elsewhere. (See p. 846.)

In concluding his remarks the superintendent observes: "It may be admitted that during one period in the history of schools it was permitted to teach anything but what was immediately useful. That time has passed. * * * These several forms of industrial education may all be considered as valuable in two ways: (1) for mental discipline, and (2) for practical utility. While it might be difficult to justify them for the latter reason, it is the prevalent opinion that they can be defended on educational grounds. That wood-working, sewing, and cooking are of immense practical importance is certainly no argument against their adoption as an integral part of a school training."

¹ Some weeks after this chapter had been written, the report to the New Jersey Council of Education on Manual Training came to hand; but it was too late to use it further than as appears on p. 829, foot-note 2. We will use the matter in our next report.

Washington, D. C.—The following is taken from the last report of Superintendent Powell:

"The school year ending June 30, 1887, was marked by the introduction of manual training into the curriculum of the public schools of the District of Columbia. * * *

"The character, divisions, and scope of the work in manual training as now taught in our schools is set forth under the following heads:

"Drawing.—The subject of drawing gives the initial work for developing manual skill. Through its entire course, from the first grade to the high school inclusive, it is divided into two parts—construction and representation. In the constructive part hand and eye are trained, while at the same time ideas concerning the forms made are developed. The work of representation gives manual training by the drawing of the constructed forms. It does more, it correlates physical and mental processes. A scientifically constructed form induces systematic, scientific methods of thought. The thought logically and accurately expressed by oral and written composition complements, perfects the physical culture secured by the construction and drawing. I mention constructive language here because I believe that as a means of the most complete training, as well as a matter of school economy, the manual and mental processes should coöperate on the same subjects. Each is defective without the other, and without such complementary work the training is one-sided still.

"In the first three grades, modelling in clay, stick-laying, paper-folding, weaving, and various other processes of the Kindergarten system unite hand and mind and eye in constructing and drawing geometric forms, and natural forms based on these. Constructive language is taught in the first grade and follows the entire course. The fourth grade continues the preceding work, notably that of paper folding and cutting, and also modelling in clay. The forms made and drawn are applied to objects of ornament and use. Invention is employed for decorative purposes. Neat and workmanlike processes, involving the use of many tools, such as needle, thimble, scissors, hammer, nails, etc., are here taught. The fifth grade includes work like that of the fourth, with the addition of the construction of working drawings. From these drawings patterns are made, and objects constructed, after which the completed objects are represented by drawings. This addition continues through the remainder of the course.

"The thought of progressive development runs through all construction and representation. Each year introduces more intricate designs, more skilled execution of objects and representation.

"In the high school, complex forms in clay and cardboard are made. Constructional, free-hand, and mechanical drawings have place here, as well as executed designs for wall paper and fabrics. Owing to this one branch of manual training many of the graduates of the high school have become designers, draughtsmen, and architects.

"The points emphasized are the scientific construction of models by all the pupils; representation by drawing these models or other objects, rather than drawing from flat surfaces; the stimulation of the inventive faculty by design work for ornamental and other useful purposes, and the coöperation of the mental and physical powers.

"Sewing.—This work has served a double purpose—the one for which it was designed, that of giving instruction in sewing, and another, that of increasing the interest in other school work. It refreshes and invigorates; it introduces a marked change, which breaks up the oft-time dull routine so destructive to the spirit of real intelligent work.

"Cooking.—Each cooking school has for its use a kitchen and a mixing room, complete in their appointments. Each is also supplied with blackboards for the representation of many of the food substances which, without such an aid, would be less thoroughly understood. Instruction is given on food materials—their nature, sources, effects on both body and mind, and consequent relative values. Much of the work makes application of the physics regularly taught in the schools. This, with the thorough study of food materials, the experiments, observations, and inferences made by the pupils, gives the work in cooking a scientific and at the same time a practical basis. (The course in cooking is given p. 852.)

"Shopwork.—The work in shops did not, in the year of its introduction, follow the prescribed course, owing to limited facilities in the way of work rooms and tools; however, the plan followed was in harmony with this course. When facilities and time for practice were lacking a general idea of methods was developed. To give breadth and scholastic power to this work instruction was given in the qualities and appearances of different woods under various conditions, the sources of supply, the uses and commercial values; the nature of iron, the location and importance of iron fields, the processes necessary to fit it for use, and the uses; the manufacture and uses of steel, with sufficient historical study of these subjects to show the influence of their use upon the material development of the country.

"The aim is to make this work practical in all its bearings. It includes the correct use of tools, the laying out of work with the aid of knife, pencil, and try square, and

the making of chamfered blocks, moulding, and various T joints. Simple special pieces are made, such as tool racks, shelves, and squares for school-room use. Towel racks and steps for the cooking schools are successfully undertaken. Originality is drawn out by the designing and by making objects which are constructed from original working drawings. The eighth grade shows more difficult constructions than the seventh.

"In the high school many articles of furniture are made for the laboratories, the cooking schools, and the other schools.

"After learning the care and management of the fire and the shifting of belts, forging is introduced by heating and drawing to a point a square rod of iron. This shows the value of care and attention in the performance of the simplest tasks. More difficult work in iron follows, which is succeeded by work in steel, including drawing and the making of punches and chisels, which are tempered and hardened by the pupils themselves. Each pupil is required to continue his efforts until he has made a chisel which will cut iron and steel without injury to itself.

"In the department of wood turning practice is given with chisels, gouges, calipers, and other wood-turning tools. Elementary work in this branch is soon followed by more difficult and useful designs, including drawing models for the schools of the city, standards for physical apparatus, telephone receivers, Indian clubs, etc.

"The practice in moulding includes moulding from a simple flat pattern, from turned patterns, and from those of difficult design. Thus far the work has been limited to two-part flasks and the casting of cylinders, hollow cylinders, wheels both plain and grooved, handles, etc. This training gives the pupils a knowledge of moulding, the difference between cast and wrought metal, and also a knowledge of correct forms for patterns from which he is to mould. As far as practicable it is intended that the pupil shall make a casting from a pattern which he has made from his own drawing.

"In the draughting room the elements of mechanical drawing are taught."

Jacksonville, Fla.—From the report of the agent of the Slater fund for the education of freedmen, we learn that one of the graded schools (for colored) of Jacksonville has had an addition made to it for "industrial instruction." The cost, eight hundred dollars, was borne one-half by the city, and the other by citizens white and colored. Work was begun in November, 1887, with 76 boys and 98 girls from 14 years and upwards. "The work at this school has attracted large attention," says Mr. Haygood, "and strengthened greatly the conviction that industrial training must come into the public school system."

Beardstown, Ill.—Says the superintendent, in a communication to this Office: "We have hardly been at work long enough to speak of results. The boys enjoy the work very much. Accuracy, patience, and a quickening of the observing powers are noticeable results. A few boys who are exceedingly stupid in other work are among the best in drawing and shop work. The work that we are doing meets with almost universal favor among the patrons and citizens. We hope to add lathes for wood working, and sewing for girls."

Galesburg, Ill.—"In considering this question," says the city superintendent, "three principles should direct our line of thought: (1) Education must be adjusted to conform to the conditions of life as these change from age to age; (2) whatever may be the definition of education, its object must ever be to make the child useful to himself and to others; (3) the public schools are for the people, most of whom support themselves by manual labor of some form.

"I do not intend to enter into a discussion of this subject, but I wish to say that nothing will tend so much to bring the child into sympathy with all forms of manual labor and to promote in him a spirit of domestic thrift and a respect for domestic virtues as to teach and exercise him, while growing to manhood, in the elements of industrial knowledge. I believe that not only his own good but that of his country demands such an education. It may be said that this is the duty of the home. So it is, and the same is equally true of much that is now taught in our schools; but the home needs the endorsement and coöperation of the State in this respect as well as in that of giving mental culture."

Moline, Ill.—To our inquiry as to the extension of the manual training course the superintendent replies: "I can say nothing definite under this head. I hope, however, at no distant day to see a department established in connection with the high school where boys and girls may be taught an advanced kind of hand-craft work." The course of this system is given in full p. 843.

Peoria, Ill.—In speaking of the results of the recently introduced instruction in wood working the superintendent of Peoria says that "it is found here, as everywhere else, there are widely different degrees of native aptitude, as well of attention and instruction. It is also found that a clear mind accompanies the skillful hand. The hope of establishing the school is that it will assist in training the mental faculties, that the work done will give mental discipline. So far the interest taken is all that could be wished."

Peru, Ill.—From the superintendent we learn that he finds manual training renders pupils accurate and ready thinkers, causes them to understand the effects of an error, pleases pupils and their parents, enables them to make useful things in school hours, and makes them capable of constructing anything needed about the schools. "Our workshop is run in connection with our public schools. The nature of our community favors it. It does not seem to me as destined to become a part of public school work. It has great value, but a choice of such must be made."

There is no intention of enlarging the work in carpentry and sewing; but wood carving will be done in connection with drawing, the pupils remaining at their desks.

Humboldt, Iowa.—From the superintendent we learn that manual training has been tried now for a year, and it is believed to be a success. "Two classes, of 12 pupils each, composed of boys and girls, worked about an hour a day at carpentry, and succeeded in doing very fair work as well as keeping up with all their other work. The instructor, a skilled mechanic, taught them to square, line, plane, saw, etc. It is a little uncertain, however, whether the work will be continued. The board did not sustain it at the last annual meeting."

From the New England Journal of Education we quote the following particulars in regard to the initiation of this work: "The introduction of a manual training school at Humboldt, Iowa, is announced. It was begun with a fund of fifty dollars, raised by subscription, and by fifty men contributing each ten cents a week for the support of the school for six months, Dr. G. H. Clarke stimulating the work."

Leviston, Me.—From the superintendent we learn that manual training has "not as yet" been engrafted on the school system. "A year ago we had what we called an industrial exhibition, pupils in the grammar schools contributing samples of their work in carpentry, fancy work, etc. The exhibition was a success, and has aroused an interest in manual training."

Portland, Me.—The subject of manual training has several times been urged upon the citizens of Portland, and the superintendent thinks it is time to ask, in view of the success attending the introduction of the subject in other places, whether the city is to remain at a standstill. More than a year ago fifty or sixty persons of wealth and position petitioned the city council to establish a manual training school in connection with the first classes in the grammar school, some of them remarking, "This is an effort to educate in the right direction;" "we wish all our city expenditures were as satisfactory as the teaching our boys the use of the ordinary carpenter's tools would be."

Baltimore, Md.—The school commissioners of the city, in speaking of "industrial education," discuss the report of the principal of their famous manual training school. "The steam engine which was built by the members of the graduating class is now used in the shops in the place of the old engine, and it supplies all the power that is needed to work the machinery. An inspection of the work of the school will show that it is thorough and practical, and that in proportion to the means appropriated for its support, it is accomplishing most excellent results."

"The object of the school is to lay the foundation for industrial employments and at the same time to recognize the value of intellectual culture and discipline, and thus to teach the brain and the hands to work together in performing the practical duties of life. The results of this kind of education must be beneficial to every community by producing more intelligent workmen and more useful citizens."

"If it was more fully appreciated by the friends of public instruction, and officially recognized as an essential part of every school system, it would tend to remove the objections of those who charge that the schools do not properly prepare their pupils for the practical labor of life."

Under the head of "manual training," the city superintendent remarks: "The successful establishment of this school has satisfactorily met the demand for introducing manual training into schools, in which pupils of about fourteen years of age with a good grammar school education are taught, but still there exists among many a demand for the introduction of manual training into the primary and grammar schools. It is generally admitted that the introduction of sewing into the grammar schools in which girls are taught is feasible and desirable, and that its introduction does not decrease the thoroughness of the other work of the schools; but great difference of opinion exists as to what extent manual training should be introduced into the primary and grammar schools. * * *

"Whenever manual work can be performed in a school in such a way as to supplement and aid the acquirement of the literary work, its introduction is unquestionably not only justifiable, but desirable. For this reason it is desirable at this time to introduce into the primary grades the construction of forms in clay for use as models in drawing, and to teach the pupils how to represent them by drawing and to introduce into the grammar schools a continuation of the work, begun in the primary schools, of constructing forms in clay, and teaching the pupils how to represent them properly by

drawing, also the construction of simple apparatus used in physics, and making in sand or clay contour maps showing the physical features of the countries studied by the grade. This work is possible, and when done will not only cultivate to an extent a correct use of the hand and eye, but will greatly aid the work of instruction in drawing, geometry, physics, and geography."

The superintendent would have the authorities "hasten slowly," until by the aid of the work carried on at the Manual Training School and that of the Industrial Education Association, recently established, and of which many teachers are members, a better knowledge of the subject shall have been obtained. He also speaks of the waste of work in arithmetic, grammar, and geography.

Boston, Mass.—The committee on manual training having been petitioned by parents and others to permit children not attending the public schools to attend the manual training schools of carpentry and cooking, the matter was broached at the full meeting of the school board by the chairman of the committee. The committee said if the matter was referred back to them with full powers they would permit such attendance when vacancies existed. This proposition was accepted by the board.

Brookline, Mass.—The last report of this system the Office has is for 1887. A summer vacation school has been provided for by the school committee. "When the new building is finished on Boylston street it is hoped," says the committee, "to make industrial education a more prominent part of our course and utilize one of the rooms in the basement for this department." Cooking had been introduced at the instance of the ladies of the advisory board and under their supervision and at their expense perhaps, for the equipment cost the town nothing. Three classes of six pupils each who should receive one lesson a week for twelve weeks. The plan has been as successful as the means would allow.

Cambridge, Mass.—The manual training experiment has been tried in Cambridge now four years (it is regretted that the superintendent has not furnished this Office full statistics of a work carried on so long). Annually seven classes each from one of seven grammar schools have received elementary instruction in carpentry. In this matter of manual training Mr. Frederick H. Rindge, of the city, has come to the aid of the school authorities and has presented them with a fully equipped "industrial school building;" but under conditions that will only permit the authorities to coöperate in carrying out the intentions of the benevolent donor "so far as the industrial school" is to be brought into connection with the public school system. [Mr. Rindge's school is particularly mentioned under "Trade Schools"].

Chicopee, Mass.—"Should the town," says the superintendent, "build a new high school building, I would advocate the establishing of a department of manual training for boys, in, at least, one industry, say that of light carpentry.

"The association of mental training and the cultivation of manual skill are to-day recognized as most important factors in the education of boys in many of the largest cities of the Union.

"Had we such a training, many boys who now leave school before entering the high school would continue in school through the course, feeling assured that in a great measure they were being fitted for the common duties of life, which must be performed by nearly all of them. Few can enter the professions, become book-keepers or clerks; most must make their subsequent walks in life through the avenues of industry, and must earn bread through some one of the industrial trades; an admirable start towards this most desirable end would be given by a knowledge of the care and use of tools, which would be derived from a manual training course in school."

Hingham, Mass.—The superintendent of Hingham does not think that towns, single handed, can accomplish anything for the advantage of the young in manual training; but thinks in time State central schools will be established.

Holyoke, Mass.—The school committee in their report say: "A well-developed public sentiment in favor of industrial education, which the city government should not fail to recognize, demands that some action be taken in the near future for the establishment of a school for this purpose. Generous offers of individual assistance are understood to have been extended as an inducement towards this end, and there can be no doubt of the usefulness and speedy success of such an undertaking in this city."

Lynn, Mass.—"Last year," says the superintendent, "our school committee considered the expediency of introducing manual training into our city system. The matter was then referred to a special committee, which has recently reported that it is inexpedient to introduce manual training into our city system at present."

Rockland, Mass.—"There seems to be a growing sentiment among the common people in favor of introducing industrial training into the public schools," says the school committee. "The bent of the public mind to-day is towards something practical. Now, although there is just complaint that a great deal that is useless is being taught in our schools, yet the remedy does not lie in introducing tools, or in making a workshop in the school-room." Two reasons against the introduction of the study are (1)

because there is hardly time now to teach the fundamental principles, as nearly all of the teachers have too much to do and too many classes; and (2) an intelligent and virtuous citizen is of more value to the State than even a skilled workman.

Springfield, Mass.—The appropriation of three thousand dollars for the continuance of manual training and of the purchase of property for a school, shows, says the school committee, the favorable opinion of co-education of hand and brain held in their community. Of such instruction, girls as well as boys should have the benefits, and they recommend that two rooms of the manual training school be set apart for instructions in cooking and domestic economy as usually taught.

Waltham, Mass.—Early in the year 1886 the board appointed a subcommittee to propose a feasible and economical plan of grafting manual training upon the public school system. The plan recommended was elementary in character, and consisted of regular instruction at a bench with simple hand tools. "Inasmuch as this instruction," says the school committee, "is wholly optional with pupils, and on no account will be allowed to interfere with regular and allotted work of any school, there can, we think, be little objection to give it a fair trial." The superintendent has failed to reply to the Bureau's inquiry for statistics.

Watertown, Mass.—An education, says the superintendent, should be a preparation for life. A common school education, in as many ways as possible, should be a preparation for usefulness in life. A true education is at every point in its advance double-sided, in-leading, and out-leading. Language has stamped this second side as the important side; for if in its derivation education is other than out-leading the word is misleading. The world has pronounced the second side the important side. What it wants of a man above all else is productiveness. Froebel says, "It would be a most wholesome arrangement in schools to establish actual working hours similar to the existing study hours, and it will surely come to this." "In fact, Froebel," the superintendent observes, "founded all the manual training schools that are or shall be when he published his occupations for the kindergarten and his plan for a school workshop." The superintendent summarizes the educational worth of "industrial instruction" as (1) awakening and training powers and talents which would otherwise remain dormant and untrained; (2) setting in activity the greatest imaginable number of senses and powers and securing knowledge which no other instruction can secure; (3) giving a foundation for much theoretical instruction and placing the aim of such instruction intelligently before the children; (4) serving as a test for much theoretical instruction; (5) securing knowledge and understanding much more easily and impressively, and consequently more lastingly than ordinary instruction can; and (6) teaching the child to value, observe, investigate, test, compare, and invent.

A complete scheme of industrial instruction for schools under his charge would include for boys and girls alike modelling in clay, drawing, and such other forms of hand-training as are adapted to general school-room practice; for the girls only, sewing and cooking should be added, while for boys wood-working would be sufficient.

The chairman of the school committee thinks it would be wise to try the experiment if it can be made without interfering with other branches.

Winchester, Mass.—"The manual training department," says the superintendent, "received its regular appropriation last March (1888), and, limited to sewing and carpentry, it has given sufficient satisfaction to have its existence continued. My own opinion of the matter is that manual training under some of its elementary forms will be the salt to preserve our system of public schools and prevent us from becoming a nation of ignoramuses in skilled industries."

Worcester, Mass.—The sentiments of Superintendent Marble are well known. His remarks on the subject of manual training have appeared in a publication of this Office that has already been placed in the hands of the inquirer.¹

Bay City, Mich.—"Of all the educational questions which are at present under discussion," says the superintendent, "that of technology easily occupies the first place, and many of our larger cities and several of our smaller ones have already made manual training a part of their educational system. By manual training is not meant the teaching of trades, which is merely mechanical in its processes, but the training of the mind through the practical application of the principles of mechanics. That the mind can be as thoroughly disciplined by this as by any other method of instruction is now generally admitted, and the problem of engrafting it upon our present public school system is being carefully studied. The subject has not yet passed the experimental stage, but, nevertheless, sufficient results have already been obtained, especially in the schools of Boston, New York, Philadelphia, Omaha, and elsewhere, to warrant investigation. * * * Bay City cannot afford to lag in the rear, and I certainly hope that you will give the subject the attention it deserves."

¹ Circular of Information, No. 6, 1888: Proceedings of the Department of Superintendents of the N. E. A. at its meeting in February, 1888.

Detroit, Mich.—On February 23, 1888, the Detroit, Mich., board of education received the following report of the special committee on the manual training school, through Inspector O'Flynn:

"Your committee, to which was referred the subject of the introduction of manual training in our schools, report as follows: The bulk of our children cannot make a living except through handwork. Intellectual training alone is therefore an insufficient preparation for life, so far as they are concerned. Man by nature is a tool user. As much of his superiority comes from his skilled hands as from his brain. Neglect to educate his hand and you deprive him of a large portion of his power. The hand is the peer of the intellect. It executes what the mind conceives. The most brilliant ideas are shorn of their splendor if the hand is without the necessary skill to express them. The hand and the mind should receive equal culture. True education looks after the whole man. Any education short of this is a failure. To make man a harmonious being, such as he was intended to be by his Creator, all his powers must be equally developed. Such development, according to Everett, was found in Washington, of whom he said that he reminded him of a circle, every point in whose circumference is equally distant from the centre. The present system of education is strongly biased in favor of professional and literary pursuits, to which there would be no objection were every man's vocation in life law, medicine, theology, or kindred avocations. But these are not the callings for which the majority are intended. The average man must earn his bread by the sweat of his brow, and must be a producer, in order to obtain support. Manual labor has fallen into disrepute among us, and the result is that the great majority of our young men go into the professions, while we have to go abroad for skilled mechanics. The professions are overstocked, and two-thirds of their members earn very precarious livings. Those who do not seek the professions join the huge army of poorly paid clerks and book-keepers, or become Micawbers, dawdling away life 'waiting for something to turn up.' The condition of our girls is still worse.

* * * * *

"Your committee, therefore, earnestly recommend the establishment of such a school, which may be termed the Mechanical High School. The literary high school is deemed a necessity by those who believe in purely intellectual culture. * * * In recognition of this claim our present high school has been established and generally supported. The working people of Detroit and the other friends of manual training are entitled to as much consideration as the advocates of purely intellectual culture, although they do not claim it, when they ask for the establishment of the high school for mechanics. The entire plant, when completed, will cost under \$100,000, and the current annual expense will never exceed \$15,000, which is less than the annual cost of either the Bishop or Cass schools. For the first year the current expense will not exceed \$10,000.

"Your committee recommend that at first so much of the building will be erected as will be sufficient for the study and recitation rooms required for the school when completed, and shops for the first year's class. The following year the balance of the building which will be required for shops for the remaining classes can be erected. The cost of the site, building, and equipment for the first year will be \$60,000, distributed as follows: Building, \$23,000; site, \$25,000; the equipment of four work rooms for cooking, sewing, drawing, and carpentry, \$3,000; equipment of study and recitation rooms for four hundred pupils, \$2,400; contingencies, \$6,600. The addition to be made to the building in the second year will cost \$23,000, and the shops required for the second, third, and fourth years can be fitted up for \$1,500 apiece. These figures are reliable, as they have been obtained from the superintendent of the Toledo Training School.

"Your committee therefore recommend that an appropriation of \$60,000 towards the plant and \$10,000 for current expenses be asked for this year. These sums should be cheerfully given for the reason that all the schools actually need this year are a primary school, to take place of the Clay School, and another in the neighborhood of the boulevard. The new Clay School will cost \$25,000, and the other \$5,300. This happy condition of things, as our superintendent states, is owing to the fact that the schools built last year are sufficient to meet the wants of all who desire an education. Last year the amount appropriated for new schools was \$146,511. The two primary schools referred to will not cost over the amounts estimated for them, the total of which is \$30,300. Another such opportunity for starting the training school may not be presented in years. Another argument in favor of it is that a portion of it can be used for the ungraded school for three years, during which the second, third, and fourth classes for the training school will be in process of formation."

The report was referred to the committee on finance without discussion.

Minneapolis, Minn.—Metal-working is to be introduced and all the work now commenced will be developed. The subject of sewing is also agitated, as we learn from the superintendent in a late request for statistics and other information on that subject.

Concord, N. H.—The manual training school was organized by the school board acting for the Union School district. Boys of 14 were allowed to attend, on condition that they would maintain their regular school work, in classes of ten. The superintendent says that "the results attained are extremely gratifying and the interest among the pupils is great. Manual training is not compulsory, but all vacancies are quickly filled. No diminution of interest in regular school work is noticed in pupils attending the manual training school. The work is confined to carpentering, but will be enlarged so as to embrace other departments in the near future."

Dover, N. H.—Under the head of "Practical Education," the chairman of the school committee observes: "Occasionally we hear the demand for a practical education, and when we analyze the demand it is found to be a claim that those subjects, and only those, be taught which lead directly to earning a living. When a celebrated artist was asked by what process he mixed his colors, he replied, 'I mix them with my brain, sir,' and he who has the greatest brain power, other things being equal, can secure the best remuneration, whether his efforts be in literature or manual labor. The object of an education is to make a man."

Manchester, N. H.—The chairman of the school committee, under the head of "Practical Education," speaks of the need of developing it as already represented in the evening schools and in the high school. A strong contrast is presented by the day and evening schools. In the latter are those whom circumstances have compelled to learn the lessons of industry and "now need intellectual growth;" in the former this is reversed. "There is an unmistakable demand for something supplementary to the common school to meet this need. Drawing schools, laboratories, manual labor schools, and the like may seem to many of our older citizens like useless innovations, and yet the swiftly changing conditions of our day make them necessities." The vast massing of men in cities has revolutionized all conditions, and though the essential laws of education do not change, "its methods and aims must move on."

The superintendent of the city says that though manual training is offered as the great panacea for prolonging the time the pupils remains in schools, its strongest supporters only advocate its introduction until the higher grades. While he thinks favorably of its introduction in these grades, he fears that it will not influence the primary pupil to continue his school life.

Hoboken, N. J.—In the annual report of the board of education of the city of Hoboken it is said of manual training, "industrial education," as it is there called, "We are confident that this is a part of education which will never be thrown aside or become useless. It will assist families in many ways which cannot now be foreseen. It can be prosecuted quite successfully in the class-room."

Mont Clair, N. J.—"I am convinced," says the superintendent, "that manual training is both intellectually and morally advantageous. Pupils lose nothing, but rather gain in the purely intellectual branches. Self-respect and ambition are frequently first awakened by success in manual work. We shall very soon put in an engine and some turning apparatus."

Newark, N. J.—As the superintendent sees the question, all the confusion and evident contradiction arise from an incorrect and confused conception of what education really is. The best definition of this much-defined term that he has met is, a preparation for complete living. What is manual education? What is its object or province? Can it be made a part of the public school course? A sharp distinction,—he quotes President Gilman, of Johns Hopkins University,—should be drawn between physical, manual, industrial, and technical education, and he thinks "the value of manual training as a means of general education and as a method of intellectual culture, and a means of promoting accurate expression, must be generally acknowledged." "And I think further," he continues, "that it has great value as a preparation for the industrial or professional pursuits, or for advanced technical education, and I am forced to the conclusion that the time is not far in the future when it will take its place side by side with all other educational methods and processes." As to the introduction of manual training into the public schools, that is not a question, but a fact.

Orange, N. J.—"The subject of industrial drawing," remarks the city superintendent, "suggests that of manual training, with which it is closely connected, and of which, indeed, it may be considered a part. While not unanimously endorsed, the balance of opinion among those whose views in educational matters are entitled to weight appears to be decidedly in favor of manual training in public schools. * * * If manual training is introduced in the schools, the subjects taught cannot be added to the curriculum as it stands at present. School hours are already long enough. * * * It must also be strictly borne in mind that the idea is not to make trade schools, but to give such general training of eye and hand and mind as to better prepare the pupil for any business or profession he may follow in after life."

Paterson, N. J.—The superintendent, in replying to the request for statistics, observes: "The results attained in wood-working, etc., in the training shop have been very encouraging. The pupils have been enthusiastic in their interest, and many have exhibited natural skill or mechanical genius which would serve to point a moral, *i. e.*, that such pupils should be allowed to follow the 'bent' with which nature has endowed them rather than to take up professions or employments for which they have no aptitude and in which they would prove to be mediocre." The purpose of the course is to develop thought while training the hand—hand and brain being co-laborers.

The work may be enlarged, but what has already been done is quite elaborate for a beginning. "The problem is how to work the whole in connection with the usual round of studies without undue interference with the essentials of the ordinary course."

Albany, N. Y.—The superintendent says, after quoting the argument of the New York Industrial Association (page 832): "From our brief experience we believe that it is established that manual training is legitimate education work in our schools; that its tendency is to keep boys longer in school; that its effect is to round out the development of the pupil; that it promotes good order and discipline; that it has a moral force, and that it dignifies manual labor by removing false notions of degradation. * * * While in a few places the girls are put in the shops and given the course so successfully with the boys, and while much that is forcible could be said in favor of such a plan, the general practice has been to limit the course for girls to sewing and cooking. It seems to me that if sewing were introduced, it would be best to use it in the grammar schools. To do this systematically and completely two or more special teachers would be needed to give as little as one lesson a week in all the grammar grades. The high school pupils are of an age and from surroundings such that would make instruction in ordinary sewing generally superfluous.

"With my present lights I am not prepared to advise the introduction of any specialized form of manual training in the primary and grammar schools. We have drawing in all grades and with a few modifications this, the foundation of manual training, will accomplish its office of preparation. In the lowest primaries we have kindergarten methods with constant instruction in form, color, modelling in clay and sand, etc., which need only be extended on the same lines, as the complements of drawing, to form a good preparatory course for shop work in the high school grades, at which point the pupils have attained a physical and mental maturity that will enable them to handle real tools with effect.

"I would prefer a line of work with cutting tools, for instance, modelling and designing, followed by wood-carving for the girls; but a more complete preparation in the primary and grammar schools than we have now should precede any attempt to place such a course in the high school where alone it can be well managed."

In writing to the Bureau the superintendent says that it is hoped that a cooking school will be added.

Brooklyn, N. Y.—The superintendent's remarks are so extended that only an abstract of them can be given. He quotes Emerson to the effect that "Every thought that arises in the mind, in its rising aims to pass out of the mind into act, just as every plant, in the moment of germination, struggles up to light. Thought is the seed of action, but action is as much its second form as thought is its first. * * * What is in will out. It struggles to the birth. Speech is a great pleasure, and action is a great pleasure; they cannot be foreborne." The advocates of manual training, says the superintendent for himself, claim that it is essential to train the hand to express thought by "action" as it is to train the power of speech, and this is a more logical statement than to contrast brain training and hand training, as is sometimes done; it is thought expending itself in action, not the physical movement, that trains. As to the claim that manual training is education, that it trains the hand and the eye and the intellectual powers, that, the superintendent thinks, "is founded upon but a meagre field of observation." To offset such claim he quotes from Dr. Harris, of Concord, Mass., who says: "I do not think that the instruction of branches of manual training can be justified on the ground that they are of disciplinary value, and especially developing to the intellect, but if desirable at all their introduction must be defended on the ground of their general utility to the pupil as a future means of livelihood." To the claim that manual training lays the foundation for any trade he quotes from the same author that "Special training in one branch of manipulation gives the muscles a set in one direction and unfits the workmen for other employments. * * * In general, the trades that deal with the metals and wood unfit one for the manufacture of textile fabrics, for the latter requires delicacy of touch."

On the other hand the superintendent is disposed to think that sewing and cooking "come within the category of things universal, and therefore might, perhaps ought, to be introduced in all our schools," and this can be done without disturbing the equilibrium of the school work or adding materially to its cost. To fill the really existing need of

special schools to teach trades, the Pratt Institute (see p. 894) has been founded; but in the grammar and primary grades the superintendent believes that only universal studies should be taught, until experiment has demonstrated the fitness of manual training for introduction. If wood and metal working are to be introduced it should be done in connection with the scientific mechanical course that he has suggested for the Boys' Central School, where the courses are optional.

Jamestown, N. Y.—"Training of the hands and the muscles, with a view to practical uses in the future," says the superintendent, "is rapidly becoming an essential feature in the education of American youth. Already we have passed the limits of the field of experiment and many of our children are receiving the benefits of this department of instruction."

Newburg, N. Y.—"Our work in manual training," says the superintendent in a letter to this Office, "has proved very satisfactory. I do not think it has been a hindrance to other studies, but on the contrary, by increasing the interest of pupils in their school work, has incited them to greater activity in other branches. I think it has been the means of retaining pupils for a longer time in school."

"The carpentry course will be extended through a fourth year. During the past year a five-horse-power electro-motor, eight lathes and jig-saws have been introduced, and the salary of the instructor increased from nine hundred to twelve hundred dollars."

New York, N. Y.—As the city superintendent was a co-laborer in the work of preparing the report given on page 859, his opinions as to the value of manual training and the feasibility of introducing it into the public schools may be at least approximately inferred.

The president of the board of education remarks of the action taken: "The introduction of manual training of the simple and fundamental character proposed, so incorporated with the regular course as to be illustrative and helpful, will, it is believed, be of much practical value. It will at the same time be so arranged as to add no additional burden to the course, require no extension of the school hours, and displace no important studies."

"It will tend, it is thought, to increase the pupils' interest in their studies, to quicken their apprehension of them and of their practical applications, and to awaken natural ability. The monotony and burden of school hours will be varied, and the theoretical instruction there given be connected with the actual duties and necessities of life."

The number of schools having manual training is increasing, but no change or alteration of the course is contemplated.

Yonkers, N. Y.—The president of the board of education, in speaking of "industrial education," says that it can be properly arranged under two general methods: (1) general class-room instruction in the elements, aided by text-books graded to the capacity and progress of the pupils, as is the case with the subjects now taught in the schools, and by such object teaching with tools and industrial appliances as will best serve to illustrate the principles as they are taught; (2) manual training. The second method has been the one generally discussed and has been a stumbling block because educational authorities have recognized from the very outset that to commence a carpentry course would leave them no alternative but compliance should a demand be made for instruction in stone-cutting or machine-shop work, and to accommodate all would be out of the question by reason of the cost. "For these reasons the progress of industrial education in the public schools of this country has been slow, while the righteous demand for a more practical education increases daily. We do not believe that the public schools can or ought to be made to take the place of an apprentice system, or of regularly organized or exclusively industrial schools. We do, however, most earnestly believe in the great usefulness of a judicious employment of manual training to the easily limited extent of illustrating the principles taught in the class-room, and to that end and that only should tools and appliances be furnished for the use of the schools. We are profoundly impressed with the belief that a permanent, complete, and satisfying solution of the question will be found to lie in the direction of oral, text-book, and object instruction in the class-room in the elementary principles of mechanical arts in general, and their special applications in the various industrial vocations."

After noting that this instruction will impress the pupil with the dignity of labor and will increase the usefulness of the schools, the board recommend that a small appropriation be made for purchasing tools.

Cleveland, Ohio.—The president of the board of education in his report expresses himself on the subject of manual training thus: "The action of the board of education preceding ours, united with our own in availing ourselves of the permission of the Legislature to levy a tax of one-fifth of a mill for the purpose of training our scholars in manual and domestic purposes, proves to have been most advantageous and fortunate." The remarks of the superintendent touching the purpose for which the school was founded are given on page 891, this being a manual training school.

Columbus, Ohio.—"The subject known as manual training in more than one sense may be classed," says the superintendent, "as one of the most useful that can be incorporated in the course of study in a system of schools. * * * Were no other object attained than the general culture derived from the skill it gives to eye and hand and the training of mind, it would be of great value; but besides it excites an interest in industrial operations, and gives an opportunity for the development of power, which otherwise is likely to be overlooked." After describing briefly the introduction of manual training into the schools of France, the superintendent continues:

"In view of the successful experiment in Paris, is it any wonder that members of the board are enthusiastic, and conscientiously work for the incorporation of manual training in our school system? * * * I venture the prophecy that not many years will elapse before, with modifications and adaptations, it will become a part of the curriculum of the public school system of all enlightened nations. I do not see in its introduction the correction of all defects, but I do believe it will greatly improve the present system."

Erie, Pa.—The principal of the high school speaks of the subject of manual training to the following effect:

"It is apparent to the most casual reader that the chief topic of discussion at the present time in the education world is industrial education. Complaints of the inefficiency of our public school system in fitting our boys and girls for the practical duties of life are heard on every side. From press, pulpit, politician, statesman, and school man come the general charges that the public school courses are 'overloaded with too many embellishments;' that the common English of the fathers is side-tracked by too many 'extras;' that public school education is 'spread over too much ground;' that it is a mere 'method-grinding machine, run by teachers who are the slaves of routine and red-tapism;' that our public schools are 'too much taught;' that 'under the wise neglect of old-time methods boys and girls developed far more individuality and strength than under the modern coaxing-coddelling-explaining-everything system;' that the entire tendency of public school education is towards the 'abstract,' towards the occupations that 'involve only mental training,' and away from the occupations that demand the use of the hands."

The principal then quotes from public utterances of the governors of Massachusetts, New York, and Pennsylvania on the tendency of public school education to make industrial pursuits repugnant to the graduates of the public schools, and believing such statements untrue he applies the crucial test, examining the statistics of his own school since its foundation:

"The present occupations of those who have been educated in the public schools should most effectually show the truth or falsity of this charge. If true, the majority of such occupations should be *mental* in their character; if false, they should be *manual* or *industrial* in their character.

"These are the facts: In the 20 years from September, 1866, to June, 1886, there were 598 boys in attendance at the high school. As far as could be ascertained they were distributed at the close of the school year ending June, 1886, among the following occupations:

"In manual occupations there were: Trades, 85; railroaders, 22; farmers, 28; laborers, 7; ranchmen, 5; hackmen, 2; total 149.

"In industrial occupations there were: Business, 195; civil engineers, 9; telegraphers, 6; stenographers, 3; chemists, 3; dentists, 4; draughtsmen, 1; Congressional page, 1; clerks, 97; total 319.

"In mental occupations there were: Lawyers, 17; editors, 12; doctors, 7; teachers, 8; ministers, 5; literature, 1; artists, 1; total 51.

"Miscellaneous were: Army, 1; Navy, 3; dead and unknown, 19; in school, 57; total 80.

"That is to say, out of all the boys who had high school education in these 20 years 468, or 78 per cent., are found in manual or industrial occupations, while but 51, or 8½ per cent., are found in purely mental occupations. Does this look as if 'the main fault of our present system is that it leads directly and inevitably to that which is abstract and away from that which is practical?'

"To the objection that might be made to classifying 'clerks' as pursuing an industrial occupation, it may be said that if they are not *industrial* within the popular meaning of the term they surely can not be said to be pursuing a *mental* occupation. Indeed, oftentimes the calling of a clerk calls for more manual than mental expertness. Besides our book-keepers in bank or store, clerks also include those who serve behind the counter, and more frequently than any other the calling of clerk is the first round in the ladder that ends in business."

So interesting are these statistics, contrasting so pleasantly with the jail statistics, which are being made the most of to bring the public schools into contempt, that, although

somewhat inappropriate here, we will give the record for the girls. Of the 876 girls who attended the high school during the twenty years of its existence, 291 are at home, 243 are married, 122 are teachers, 22 are clerks, 22 pursue a trade, 4 are domestics, 40 have died, and 132 are in school.

"Industrial education—instruction in the principles of drawing and construction, and in the principles of the various trades—is undoubtedly a proper thing for our laboring population to get," the principal continues, "but it cannot be imparted successfully as a part of public school instruction without changing the entire character and scope of our public school courses. They would have to be reduced to a minimum in order to make room for the industrial feature."

New Brighton, Pa.—"We incline to the belief," says the superintendent, "that outside of industrial drawing, modelling, etc., more nearly in the line of illustrative school work proper, manual training is not suited to smaller nor below the average high towns school grade. The future is not clear. Well-qualified teachers are difficult to obtain and public sentiment is not ripe for it."

Pittsburg, Pa.—"The cooking school has been wonderfully successful and is very popular with our people," says the superintendent, "and it is likely that one or two more will be opened."

Reading, Pa.—"We are about to introduce manual training; it is pending," says the superintendent.

Tidioute, Pa.—"Manual training," says the superintendent, "makes our pupils think more of themselves, makes them more careful and practical. They do not despise work and are more self-reliant. It takes away much of the drudgery of school work. It strengthens the muscles, thus aids the mind. It interests parents, thus aids in government. It cultivates the perceptive faculties, demands close attention, connects mind with matter, thus laying a broad foundation."

"We have not yet done much in iron forging," continues the superintendent. "I think we will finally confine the boy's work to Sloyd. We desire to add household economy."

Williamsport, Pa.—In reply to a request for statistics, the Office having information that led it to believe, erroneously it appears, that this city had introduced manual training, the superintendent says, after correcting the mistake, "If it should, in the course of time, prove a success in places where it is now on trial, I feel satisfied that its claims as an educational factor will find recognition in this city."

Providence, R. I.—"There is no manual training in the public schools of Providence aside from drawing, paper-cutting, clay modelling, and sewing." A request for statistics has as yet failed to elicit a response.

Newport, R. I.—The school committeemen say that the subject of "industrial education" has engaged much of their attention during the past year, and they have watched with great interest the two schools that have been established by private individuals. "We are convinced," they say, "of the great utility of such schools, not only for the distinct items of knowledge they impart, but for the invigorating effect of their training in a practical way upon the regular school work."

"No way has yet been found by which the common and the industrial schools can be made to coöperate in point of their respective hours of session. The best way is not yet clearly apparent to engraft the subject upon the public school system in an intelligent, helpful, practical manner. What direction it shall take, where it shall begin and where end, what modifications it needs to bring it into our present course of instruction, are problems which environ the subject with difficulty. No more important education question has arisen in our midst for many years, and it is to be hoped that it will continue to hold attention until industrial training shall attain the footing in our curriculum which its importance demands."

Pawtucket, R. I.—Under the head of manual training the school committee says: "It is also desirable that in connection with our schools there be established, on a limited scale to begin with, manual departments for the especial benefit of the boys, wherein they should be taught the names and uses of tools employed in the mechanic arts—woods in variety, their different qualities and where grown, etc. Passing from our schools with even a slight technical knowledge which might with profit be imparted, it would prove to be of great value to them on entering upon their practical work of life."

Knoxville, Tenn.—The cooking school has recently been enlarged and it is contemplated to introduce manual training into other schools of the city.

La Crosse, Wis.—It is not yet decided as to the extension of manual training. "We are watching other places where shop-work in wood and iron is carried on," says the superintendent.

At the 43rd anniversary of the New York State Teachers' Association, Prof. E. A. Sheldon of the State Normal School at Oswego, read a paper on the "Mental Effect of Manual Training," in which he said that the term had a wide range of meaning, as it applies to all modes of expression through the instrumentality of the hand. The hand is employed to give expression to the ideas that exist in the mind. Manual training is simply language put in objective form. As no one questions the value of language in education, the value of drawing, painting, modelling, and the mechanic arts should also be recognized. Modelling comes first, as the simplest and easiest, and is capable of awakening the deepest interest in the child. It gives definiteness to mental concepts. After modelling follow geometric forms in paste-board and paper and the representation of such forms by drawing. Here again the mind is trained by deriving its concept from the thing which has been formed and drawn.

It is questionable whether we do not overrate the value of drawing for training the eye and the hand and underestimate its bearing on intellectual training, for it not only gives accurate concepts, but fixes them permanently. All that is true of work in plastic matter is preëminently true of work in rigid substances. "There is an instinct in a child that gives delight in overcoming difficulties, and leads him to enter upon this part of his work with that lively interest that insures the most intense and fixed attention." A pupil will carry on quite as much intellectual study in connection with tool-work as without it, and with more ease. The work, as physical exercise, refreshes and invigorates, and as mental training awakens a feeling of conscious strength and moral dignity.

No distinction should be made between the boys and girls in giving book instruction, since it is as much adapted to the latter as the former. Sewing and cooking are not as effective as the other forms of manual training. Modelling and drawing as mind-training studies are beyond dispute; as to shop-work, it is not yet so certain, but in all probability will be a valuable aid *if educational results are uppermost.*

At the thirty-fourth annual session of the State Teachers' Association of Pennsylvania, in September, 1888, a symposium about "industrial education" was a feature of the occasion, the speakers being Mr. Powderly, the head of the protective association of workingmen, Mr. Fetterolf, president of Girard College, and Mr. Miller, principal of Girard College Manual Training School. Mr. Powderly said that all the change which has swept over the face of nations in the last thirty years is attributable to the work done by the schoolmaster, for he gave the foundation to the inventive brain, which had invented railways and constructed mills, furnaces, and shops, "and through the stimulating influence of our public school system, the best the world has ever known, we find the United States ahead of all the nations of the earth in point of advancement in ideas, perfection in machinery, and skill in the management of it." But the schools are not as good as they will be when they train the mind and hand together. Were a shoemaker, dead thirty years ago, to enter a shoe manufactory of the present day, he would turn away sick; he would be unable to understand the "machine stitcher, heeler, welter, laster, pegger, waxer, and buttoner." The man of thirty years hence will be even more puzzled, "for the wonderful machines that we use to-day will pale into insignificance compared with the machines of the near future." What has this to do with the American youth? Everything. He must not stand in idleness, waiting for something to turn up that he knows how to do. A system of industrial schools in which the uses of tools and the importance of science and art should be inaugurated for him, because an apprenticeship of four to seven years may only put him in possession of a trade for which there is no use. Unskilled labor will soon be unknown, and everything will be done by the aid of "one of the new agencies of force," directed by the hand of science. "Trades should not be taught in schools; but the American youth should be so instructed in hand and brain as to enable him to cope so successfully with the agencies of the world's production as to break the power of the unscrupulous employer, and make machinery the slave of man, instead of the hard, unrelenting master it is to-day." Every school should have a machinery laboratory, and a miniature farm attached, and the use of the shovel, the pick, and the plough should be taught as well as that of the lathe, anvil, and painter's brush.

Mr. Fetterolf said in his paper that the education of the great mass of the people of our country was done in the public schools, and as they leave the school they carry with them the ideas and habits which they have found in them, and their failure or success in life is in a large measure due to these schools. The school should teach the pupil how to think and work, to earn his bread, to be a useful member of society, a good citizen, and to enjoy life. The school of to-day educates in only one direction—it fails to meet the requirements of our changed social condition. It is to be expected, perhaps, that the teachers themselves will not be the first to see the defects in any system of education; it is the men who employ our boys who are to judge of the training they have received.

Professor Miller in his paper said that two things might be regarded as definitely settled already: 1. That the moral effect of associating some form of industrial training with the purely mental discipline for which the common school has stood hitherto would be very great in inculcating just ideas of the dignity of manual employments, and promoting the higher and nobler views of life which the entertaining of such ideas implies. 2. That we are firmly committed to the policy or principle of depending upon the public school to supply a good many wants with which its functions were regarded as very remotely connected only a few years ago; and that among these wants is that of skill in the trades, the decline of which has attended the decay of the apprentice system.

At the thirtieth annual meeting of the New Jersey Teachers' Association Principal John M. Green made a statement that of 160 teachers all but 25 thought that manual training should be taught in the public schools. All but 39 were doing everything possible in the way of manual training. Only 77, and these are mainly in country schools, are not doing kindergarten work.

"Our thoughts," says the State superintendent of California, "are ever seeking expression, either in speech or in action; and to express thought by action we must either embody the idea in concrete form or pursue some particular course of conduct. A complete education requires the training of the hand to express thought by action, as well as the training of the intellect and the power of speech.

"While some persons may dispute the last assertion, all must admit that it is not the mere action itself that trains, but the expression of the thought in the action. The aim of manual training is complete development, and when properly adapted to, and connected with, other accepted school training it should produce artful hands, seeing eyes, and well-trained minds, able to express thought in things as well as in words; able not only to express beautiful forms on paper, but to embody those forms in clay, wood, or metal. Just how far manual training should be carried as a part of the course of training in our public schools must depend upon future experience. In my opinion the public schools should not be called upon to teach special trades, but they may properly lay the foundation for any trade and become a help in selecting some particular trade.

"Multitudes of boys and girls, young men and young women, terminate their school and college days every year who do not know how to turn their brains or their hands to any one occupation by which they can earn an honest living. The State is wealthy in proportion to its producers rather than to its consumers; it is therefore argued by many wise men that the State should take the industrial education into its own hands."

The State superintendent of North Carolina discusses the subject of manual training in the following terms: "Education is not merely, or perhaps principally, book learning, not merely a knowledge of reading, writing, arithmetic, English grammar, geography, history, etc., which the boy or girl may carry into every-day work, but education is development of brain power—a development of all the faculties of the mind along with physical power and a knowledge of facts. Our young people must be taught to think, reason, and observe for themselves, and any process that secures this result will educate them. There is much discussion now about manual and industrial training in the public schools, and the leading argument in its favor is that in the exercise, mental and physical, of doing work with the hands, the young people are not only developed physically, but are taught to reason, think, and observe for themselves, and in a practical way to apply what they learn from books. * * * Because manual labor is so great an educational factor, and because children in cities have not so great opportunities in this direction as do the children in the rural districts, manual training for the children of the cities in some substantial way, either by private means or in the public schools, is a thing very much to be desired."

INDUSTRIAL ASSOCIATIONS.

A meeting looking to the organization of an industrial association was held in Baltimore, Md., June 24, 1887, and a permanent organization effected in November following. Many of the teachers belong to this society.

In his report to the board of trustees of the New York Industrial Education Association, the president sums up the work of the year. Of his remarks we will attempt to give but an outline.

Education, says Dr. Butler, has escaped from the theologian and philanthropist, but lingers in the hands of the politician. It is a science, and as a science means the study of the child and its environment, means death to whims and fancies, and the gradual displacement of crude theory and imperfect methods. This is the platform of the New York Industrial Association, which "believes that education is the training of the child for life, and that as our knowledge of the child increases and the conditions of life change, the means of education must be adapted to this knowledge and to these conditions. It views education as not stationary, but progressive, and holds that any enduring

ing advance must be the product not of revolution, but of evolution." Industrial training to have its fullest value must be an integral part of general education. This is the fundamental principle of the work of the association. If manual training is technical training, if it is only a passing fancy, then the association's work is in vain, but as manual training is neither, its work is justified and will be successful.

The work is of two kinds, propagandising by literary methods and by establishing schools. In the literary way a series of leaflets and another of monographs are published, and a most extensive correspondence, foreign and domestic, obtains with those interested in the propaganda, while the officers lecture most assiduously.

In the educational way, a college, a model school therefor, and a number of special classes have been instituted. The college and its model school have been fully spoken of in the chapter dealing with the training of teachers; only the public school and "extra classes," therefore, claim space here.

The pupils of several public schools in the vicinity having been invited to enjoy a course of manual training free, over two thousand four hundred applied, of whom only one thousand four hundred could be received. "Overflow classes" were formed, meeting in the evening and on Saturday morning. As these classes were held during the hours of recreation, they dwindled until they numbered in all 508.

"In accordance with our policy," says Dr. Butler, "of reaching as many teachers and students as possible, we have found extra classes for applicants whenever possible." There were 7 such classes in domestic economy, having 111 students, during the year. Trained teachers were also furnished to other schools. Several large institutions and prominent private schools have been reached in this way. In sewing 466 pupils have been instructed in 9 classes, in domestic economy to 251 in 12 classes, in industrial art to 37 in 2 classes, and in wood-working to 65 pupils in 3 classes; in all 33 classes and 930 pupils.

CHARACTERISTICS OF MANUAL TRAINING IN PUBLIC SCHOOL SYSTEMS AND STATISTICS FOR 1887-88.

So much is being said about manual training as a theory that its existence as a fact has not received the attention that would have been accorded had its growth been more uniform and its advocates more consistent. Naturally it is to this Office that the educating public looks for information as to the annual condition of manual training and the progress it annually is making. In our last report we endeavored to find our way to some conclusions, though hampered by want of statistics, and the rather diverse grounds upon which the subject was being introduced.

Since that report the theory of manual training has assumed a definite form, and we hope that our tables, the first of their kind and, perhaps, not immaculate, will also give a definite form to the *facts* of the subject.

TABLE 71.—Showing Number of Instructors, and Pupils in the Several Branches of Manual Training.

System of Public Schools.	Year of Introducing—		Instructors of—		Grades Taught.	Pupils.						Leave School Building.
	Drawing.	Construction or Other Form Work.	Drawing.	Construction or Other Form Work.		In Wood-working—Boys.	In Sewing—Girls.	In Cooking—Girls.	In Construction Work.	Whole Number.	Forming a Class.	
1	2	3	4	5	6	7	8	9	10	11	12	13
1 New Haven, Conn.	1884	1886	(3)		Woodw'k, 7 & 8; sewing, 4, 5, & 6; cooking, 7th.	240	All	All		12,000		For woodw'k and c'k'ng.
2 Washington, D. C.	1874	1886		14	All	1,020	3,000	921	34,850	24,850	12-18	For shop-work and cooking.
3 Beardstown, Ill.	1883	1886		1	7th and 8th	0	(a)	0	All	50	12	No.
4 Moline, Ill.	1879	1883			All below high school	20	18	0				No.
5 Peru, Ill.	1885	1883		2	Grammar and high school	20	0	0		42	20	For woodw'k.
6 Humboldt, Iowa.	1887	1887		1	6th to 10th	24	0	0		24	12	Yes.
7 Okaloosa, Iowa.	1885	1886										
8 Boston, Mass.	1871	1881		36	Upper grammar grades	350	10,000	1,500	0	11,850	20	For woodw'k and cooking.
9 Springfield, Mass.	1870	1886		1	Grammar and high school	126	0	0	0	126	12	Yes.
10 Winchester, Mass.	1872	1887		2	Woodw'k, 8 and 9; sewing, 4-6 years.	15	6250	0	0	265	615	For wood-work.
11 Minneapolis, Minn.	1878	1887		5	Woodw'k in high school	150		0	0		15-20	No.
12 Stillwater, Minn.				1	High school and lower						6	No.
13 Concord, N. H.	1886	1886		1	Boys 14 years of age	100	0	0	0	100	10	Yes.

b Both sexes.

In preparing its form of inquiry the Office included the query as to the date of introducing *industrial* drawing as giving information by implication and, in addition, as a means of comparison with the date of the introduction of construction work. It cannot see that there is any inference to be drawn from the comparison. The dates are, as a rule, very far apart or quite close together. In two or three cases drawing followed manual training.

But it is surprising to find how near the beginning we are of the adoption of manual training. Two-thirds of the systems have only been practicing manual training since 1886; not quite half have been established within a twelve-month, and Jamestown, N. Y., where the system has gradually been introduced since 1877, is quite old in this respect. This is called to the reader's attention, since it entails incomplete statistics.

The statistics for drawing, teachers and pupils, were not asked for, although several superintendents in their efforts to oblige the Office have included them. In New York City and in Meadville and Tidioute, Pa., every teacher is a drawing master or mistress, and it is presumed to be the same in many places.

As to the statistics of the teaching body, it may be said that wood-working requires a special teacher; and cooking and sewing, in all likelihood, may be placed in the same category. Jamestown, N. Y., and Knoxville, Tenn., have both an abnormally large corps of instructors, due to the wider range of the training, both having introduced printing. At Eau Claire, Wis., Minneapolis, Minn., and Tidioute, Pa., where the work is well organized, the instructing corps is large in proportion to the other statistics.

The column giving the grades in which instruction is given is intended merely to show where the training as a whole occurs, and not in what particular grades each subject of the course is taught, although in two or three instances something of the kind has been attempted. A full synopsis of each return is given in the text¹ to obviate constantly saying a thing and then modifying it in the table. Wood-working is only for boys of the upper grammar and high school grades; that is plainly shown.

Sewing has no particular place. In one place it is given during the "second to fourth years," in another during the "fourth to sixth years;" in another in the "fourth to sixth grades;" in another in the "seventh and eighth grades." Grades or years do not mean much, however, until it is known that the "first grade" is not the last one.

Cooking is a grammar school study, though the table does not show it. Construction is the connecting of the kindergarten with the subjects of tool work, cooking, and sewing; this also the table does not show; nevertheless it is a fact, as shown by the programmes, pp. 852-856. Any changes in curriculum that the introduction of this study has caused, that is, in the way of forcing out the older and established studies, are noticed under city systems.

Considering columns 7-10 we find that all manual training work above the kindergarten may be grouped under the four heads of those columns. Wood-working is the work for boys, while sewing and cooking are for girls and construction work is taught to both boys and girls. The introduction of wood-working is not always accompanied with sewing much less with cooking, but it is very evident that where sewing and wood-working are both present, the sewing pupils are frequently far more numerous than the wood-working. Take Newburg, for instance, where the disparity is as 4 is to 1, or New York, where it is almost 5 to 1. This is natural, for sewing is, like drawing, perfectly consistent with work of the school-room. In an age when sewing machines are constantly becoming cheaper as patents expire and "the condition of a sewing girl" is synonymous with poverty, the commercial value of sewing must be small, and even its domestic value, except in certain forms, not what it was thirty years ago; but the habits of attention which it engenders, facilitated by having something tangible to attend to and its peculiar character as a feminine occupation, eminently fit it for the manual training of girls, although it is said to be not so effective as other forms (page 872).

As far as the table goes Washington, Boston, New Haven, New York, Pittsburg, and Knoxville are great centres of cooking. At Washington, Boston, New Haven, and Pittsburg the central school plan has been adopted, as described in the report preceding this. At New York and Knoxville this objectionable feature does not obtain. New Haven has just introduced the work; at Pittsburg it is likely to be extended, although the New York Committee on Manual Training, reporting June 29, 1887, say that as to the introduction of cooking into this city it had not yet even been dreamed of. It appears that the introduction has been facilitated by private means, a citizen, Mr. Phipps, jr., having employed a teacher.

It is difficult to see how construction work, as a matter of training of the sense of form and of developing constructive faculty, can be objected to. None of the disagreeable elements of shop-work, so strenuously urged by the opponents of manual training, are present; no central shop, no shop in garret or cellar is necessary; the work is done at the pupils' desks. "Modelling," says Mr. Chas. G. Leland,² "is drawing in clay. Any

¹ Page 880 *et seqq.*

² Circular No. 4, 1882, of this Office.

child who can copy an old shoe with a pencil can make it from a plastic material. More than this, it is easier to model anything than to draw it." The geometrical conceptions implanted by construction (geometrical forms in paper and clay) cannot fail to commend the work to those who would sustain the study of geometry when it has become a matter of definitions, axioms, and logic. In fact, to attack it is to attack object-teaching, and thus reverse the usual order of present educational procedure. Drawing is intimately connected with construction, the two advancing hand in hand. If the reader will turn to p. 843 this fact will be shown as practiced in the schools of Moline, Ill.

At Washington undoubtedly is manual training the most extensively introduced; New Haven following, and Paterson, N. J., where "clay moulding, sewing, and kindergarten work" is "preliminary to all," comes next. In New York City the work has been introduced into several schools only and is an experiment. In Meadville, Pa., and Jamestown, N. Y., the work is thoroughly introduced, and those systems give the instruction only to twelve or fifteen hundred pupils because there are no more to give it to.

Of the 20 systems giving instruction in wood-working 7 have a shop in the building in which the manual training pupils pursue their literary studies. In New York City there is known to be more than one school thus provided with a shop. Beardstown and Minneapolis are known, and Mont Clair thought to have but one shop. Cooking, with the exception of New York City, also requires the pupils to attend a central school.

The totals have been obtained, as they may be of some use to the reader, though inadequate for statistical manipulation.

a "One day each week."

b See text, p. 882.

Considering Table 72 as a whole, it is a matter of some difficulty to arrive at any general conclusion. If the reader will turn to page 853 he will find the manner in which the several subjects have been woven into the public school curriculum of New York City, and can draw safer conclusions than can be conveyed by many words.

Considering the columns individually, lessons in wood-working consume about two hours of the week. Minneapolis and Stillwater, Minn., are decided exceptions to this, at each place a daily lesson being given; but in both instances wood-working is confined to the high school pupils. Had the superintendent of Minneapolis filled the blank for manual training schools (those contained in the second part of this section) the statistics

of the wood-working department would have been included with them; for it is contemplated to introduce metal-work (forging?), and the school will probably follow the type set by the St. Louis Manual Training School.

The lessons last for one hour, or for two, according to their frequency during the week. In making these, as in making the following general statements, variations have not been noted, and the statements should be compared with the table itself. Sewing shows more uniformity; the time a week is two hours, the number of lessons two as a rule, the time an hour for each. Peru, Ill., is quite an exception.

One lesson is given in cooking a week. At New Haven, Washington, Boston, and Oskaloosa the time is two or three hours a week; at New York and Knoxville, one. As to construction work it seems that in several instances it has just got a finger into the glove, if the curriculum of the public schools may be compared to a glove, and in others has got the whole hand in, and has the usual thirty minutes consideration every day or two.

Total.....	18,127	22,373	6,179	3,154	1,526

a Donated by ladies.

b Paid by a citizen for two years.

One of the great objections to introducing manual training is the cost. This is perfectly valid as applied to the shop adjunct in which wood-working is given, but it will not hold against construction work, which has lately taken a definite shape.

The New York committee on manual training gave the following estimates of the cost—

(a) Of beginning:	
Workshop outfit.....	\$300
Kitchen outfit.....	200
Construction or preparing room for each.....	60
(b) Of maintaining for a year:	
Renewing outfit, 10 per cent.; of—	
Workshop.....	30
Kitchen.....	20
Material for—	
Wood-working.....	50
Kitchen.....	100
Sewing.....	50
Construction work.....	25

To pay the teachers necessary to instruct 60 departments in wood-working, cooking, and sewing, respectively, and 240 departments in construction work, the committee estimate that \$65,000 would be required and, in addition, \$3,500 for an assistant superintendent. The committee does not say what each kind of teacher should be paid, or how the amount should be apportioned; but as it gives the cost of introducing manual training as construction work and sewing into all these schools, and as wood-working and cooking into one-third of the grammar schools (of which there are 60), some idea may at least be obtained of the relative cost of the force teaching these wood-working and cooking, it being understood that a teacher of cooking is not available as a master of a wood-working shop, and that both subjects are grammar school "departments."

The cost of teaching construction and sewing in all the schools and wood-working and cooking in 20 grammar schools will be, estimates the committee, \$25,000; that is, for teachers' salaries. The estimate, as stated above, for salaries of a force to teach the several forms of manual training in all the city schools, including wood-work and cooking in 60 grammar schools, is \$65,000. It follows then that the cost of the force for teaching wood-working and cooking in 40 grammar schools is \$40,000, and as for 60 grammar schools it would be \$60,000, the comparatively insignificant sum of \$5,000 is left for the teaching of sewing in 60 grammar schools and construction work in 240 "departments." Considering this and the fact that no outfit is required or workshop to be fitted up, objections to the costliness of construction work are not well founded, unless the word be used by the objectors in a figurative sense as applied to waste of time.

Returning to the inferred estimate of \$40,000, and for the sake of the argument considering the teachers of wood-working and cooking to be on an equality as to pay, \$20,000 may be assumed to be the cost for the teaching of 40 wood-working "departments" or shops; that is, \$500 for teaching each department; not \$500 a teacher, however. It is the same for cooking. Having obtained the cost of teaching we can now complete the committee's estimate. Using the figures given above and forming a table, the cost of starting and running a wood-working department for one year has been estimated to be:

Outfit.....	\$300
Preparing room.....	60
Material used.....	50
Teaching.....	500
Total cost of wood-working for first year.....	910

The following year it will be about \$580, the new tools and repairs about \$30.

If there be in Table 73 any systems having, so far, only introduced one subject, and which also give the number pursuing it, some averages could be made. Such, in point of fact, there are for wood-working and for cooking; sewing and construction are too expensive to call for comment. In our last report, however, it was remarked that the cost per capita of introducing wood-working "is a very difficult question to discuss. The word 'equipment' may include many things at one place not included by it at another, vitiating results as to per capita cost. Nor is this the only obstacle. In a public school the pupil or his fictitious representative 'in average attendance' occupies the same desk every day of the school year, in these schools for manual training only an hour or two every week, and then gives place to another." From this it will be understood what is meant by "Attendance Weekly" and "Size of Class" in the following table and why we use these terms:

Per capita cost of instruction in wood-working.

System of Public Schools.	Lessons a week.		Size of Each Class.	Per capita cost of—			
	Num- ber.	Dura- tion of each.		Outfit, based on—		Maintaining, based on—	
				Attend- ance Weekly.	Size of Class.	Attend- ance Weekly.	Size of Class.
		<i>hours.</i>					
Humboldt, Iowa.....	2	1	12	\$1.17	\$8.33	\$5.00	\$10.00
Boston, Mass.....	1	2½	20	5.00	50.00	7.50	75.00
Springfield, Mass.....	1	1½	12	65.68	41.66	626.27	6192.66
Concord, N. H.....	1	2½	10	5.00	50.00	10.00	100.00
Albany, N. Y.....	2	2 ¾	24	2.40	26.00	4.00	41.65

^aThis has been inferred in this way: The total cost for the first year, outfit and maintenance, was \$2,500 for 20 pupils; that is, \$12.50 or \$125. For the last year for maintenance alone it was \$1,500; that is, \$7.50, or \$75. The expense for maintenance during the last from the expense for maintenance and outfit of the first year leaves the amounts we have given.

^bNot including a class of 38 teachers.

Cooking is the only form of manual training that has as yet been introduced into Pittsburg, thus giving an excellent opportunity for instituting the inquiry now in hand. The cost of the outfit ("fitting up the room") was \$800, and the classes are composed of 15 pupils, \$53.33 per capita on that basis, but as there were 5 different classes instructed each week for ten weeks and forty weeks in the school year, 300 pupils were instructed, and on such a basis extraordinary the per capita cost would be \$2.66; such is the duplicity of per capita. The expense attending the instruction for the year was \$86.66, on the basis of a class of 15; on the number instructed, however, it was much lower, being but \$4.33. At New Haven cooking is estimated to cost \$1,000; size of class not given.

By referring to Table 79, Column 2, it will appear that the cost of the outfit of the schools of this table is very much smaller than the value or cost of the apparatus of the schools there given.

Springfield, Mass., pays its teacher \$1,200; New Haven, \$900; Concord, \$700; Albany, \$800; Mont Clair, \$450, all in charge of wood-working. At Pittsburg the cooking teacher is paid \$1,100; at New Haven, \$700. As to the pay of sewing teachers there are no statistics; and construction work is so interlaced with the regular school work that it is perhaps impossible to separate the two so as to obtain the cost of teaching.

The cost of materials is far less than the amount paid the teaching force, which is, according to the table, by far the most expensive feature of maintaining this instruction; for the heavy expenditures for tools and building to begin work with is only an immediate one. The incidentals in some cases include rent. The cost for material in New York is due very likely to the fact that this is the year of beginning, and that expenses for new tools are included, it being impossible to separate them from the cost of material.

ABSTRACTS OF THE RETURNS TO THIS OFFICE.

Oakland, Cal.—A beginning of manual training at Oakland, California, was made, apparently at the opening of 1886-87, by connecting with the Lincoln School there. A large carpenter shop has been equipped with lathes, 21 work-benches, and 21 sets of tools for working in wood. Classes are formed and come to the shop at stated times for instruction. Principal McClymonds is assisted in the work of instruction two half days each week by the department mechanic. A drawing teacher also gives instruction in the shop as needed.

New Haven, Conn.—The several forms of manual training (introduced in 1886, two years after the introduction of industrial drawing) employed in the schools of this city are as follows:

1. Drawing: Two teachers are employed in teaching form-study and free-hand drawing, and another in teaching mechanical drawing.

2. Kindergarten: One kindergarten, with two teachers, is carried on in connection with the training school. The occupations and other forms of busy work are universally employed in the primary schools.

3. Sewing is taught all girls during the fourth, fifth, and sixth years of school life.

4. Cooking and domestic economy: Instruction is given in this branch to girls in the seventh grade two hours a week.

5. Wood-working: Boys in the seventh and eighth grades receive two hours' instruction a week in this branch.

The pupils leave their regular building to receive instruction in wood-working and cooking, the last subject having been just introduced. The total number of pupils receiving manual training is about 12,000.

The cost of the plant for wood-working only was about \$1,000; for a teacher of this subject during the year, \$900; for materials \$119, and for incidentals \$420. Cooking, as estimated, will cost \$700 for an instructor, \$125 for rent, \$125 for material, and \$50 for incidentals.

Washington, D. C.—Drawing was introduced in 1874, manual training in 1886. Kindergarten work in the first four grades, sewing in the 4th, 5th, and 6th, shop work and cooking in the 7th and 8th, and high school (where wood-work, however, is exchanged for metal-working), and model construction and drawing in all the grades form, it will be seen, a closely connected and progressive course. The pupils leave their buildings for wood-work and cooking.

The regular teachers, 520, teach model construction and drawing to 34,850 pupils, in lessons lasting from fifteen to twenty minutes, in the lower grades for four or five times weekly; in the upper grades for one hour, two or three times weekly. Sewing is given to three thousand girls by three teachers in one lesson weekly, lasting for one hour. Cooking is followed by 921 girls, who are instructed once weekly for two hours by four teachers.

Shop work falls into two divisions: (1) Wood-working, six teachers, 1,020 pupils; two lessons of an hour, or one lesson of two hours a week; (2) foundry and forge, one teacher, 112 pupils; two lessons a week of one hour, or one lesson of two hours.

In model construction and drawing, forty or fifty pupils (the school) forms a class, and of these there are 520, excluding high, normal, and rural schools. A sewing class, of which there are sixty, is made up of about fifty; a class in wood-working, of which there are ninety, of from twelve to eighteen; a class in metal-working, of which there are fifteen, is also made up of twelve or eighteen, and the sixty cooking classes have each fifteen pupils.

The outfit cost \$5,000; teachers, \$7,550; materials, \$500.

Beardstown, Ill.—The work introduced in 1886, three years subsequent to the introduction of industrial drawing, embraces (1) primary busy work; (2) moulding relief maps and other forms; (3) making simple apparatus; (4) shop work and drawing. The drawing is under the charge of the regular teachers. Wood-carving, scroll-work, joinery, and geometric forms are under a single instructor.

Manual training is given in the seventh and eighth grades; the girls, as yet, only receiving instruction in design, etc. The shop in which the boys receive their instruction in joinery is located in the basement of the school building in which they pursue their other studies. About 12 pupils form a class. The number of pupils who received manual training was 80, the lessons a week were 2, each continuing for an hour.

The cost of the plant was about \$200, for the teacher during the year \$300, of materials \$25, of new tools and repairs \$10, and of incidentals \$10.

Moline, Ill.—Industrial drawing was introduced in 1879, followed in 1883 by what Superintendent Mack prefers to call a "course in hand-craft," for the grades below the high school (see p. 843), very systematic, conservative, and it is understood effective. The course is for the most part based on drawing, being adapted to pupils of both sexes and all ages, and developing æsthetic and constructive sense; and not requiring the pupils to leave their room. Materials cost \$100 to \$125 for 1887-88.

Peoria, Ill.—Under the head of "industrial training" the superintendent of this system speaks of the wood-working instruction given in the high school building. The 30 pupils following the course belong to the third and fourth years of the high school. We regret we have received no response to our inquiries.

Galesburg, Ill.—For the past four years kindergarten principles have been employed in the primary grades, and during the last year wood-working instruction has been attempted, the basement of the high school building being used for a shop. At first the work was carried on under a student of the Chicago Manual Training School, for an hour daily.

Peru, Ill.—Here manual training preceded industrial drawing by two years. The training takes the name of carpentry and sewing. It is intended to add wood-carving to be done by the students at their desks as drawing now is.

There are two instructors, one for carpentry, another for sewing. To the carpentry class, composed of 20 pupils of the grammar and high school grades, instruction is given four times a week, each lesson continuing for 45 minutes. To receive these lessons the boys leave their building. To the girls, a class of 18 high school pupils, four sewing lessons are given weekly, each lesson lasting for 45 minutes.

The plant cost \$300. The teachers received \$125 during the year, and the material used cost \$20. For new tools and repairs \$5 were expended.

Humboldt, Iowa.—Manual training, as also industrial drawing, was introduced here in 1887. The object is to give instruction in the care of tools and in elementary joinery.

The instruction is given to two classes of 12 each, composed of boys and girls drawn from the sixth to the tenth grades. Two lessons are given a week to each class, the lesson continuing for one hour, the pupils leaving their building.

The plant cost \$100. For the year the teacher was paid about \$100, and the material cost \$20.

Oskaloosa, Iowa.—Manual training was introduced in 1886, and was preceded one year by industrial drawing. The characteristics of this course are original designing in drawing, pupils advancing from simple designs to those of floor mats, wall paper, etc., while cooking and sewing are given to the pupils of the Saturday evening school. In this Saturday evening school, originally for the poor only, the classes in the several subjects assemble, the pupils retaining for their own what is sufficiently well made to be used.

The classes, composed of six or eight, are under the charge of eight teachers and receive instruction for about two hours once a week. The whole number of pupils receiving this instruction was 130, drawn from the primary grade.

The outfit was a donation of a number of ladies, the teachers give their services gratuitously, the materials not donated cost \$100. "Last summer [of 1888]," says Superintendent Scott, "the school board appropriated \$150 in aid of the Ladies' Industrial School and opened in one of the school buildings in the other end of the town to aid pupils in that locality."

Boston, Mass.—Industrial drawing was introduced in 1871 and manual training 1881 to 1883. Sewing is well established; carpentry and cooking are but experimental. The pupils leave their building to receive instruction in cooking and carpentry.

Sewing is taught twice a week to about 10,000 girls in the fourth, fifth, and sixth years of their school course. These classes are taught by 30 teachers; cooking is taught to about 1,500 girls of the two upper grammar classes by 4 teachers once a week for half a year. Carpentry is given to 350 boys of the two upper grammar classes by 2 teachers once a week for two hours. A class in cooking and in carpentry consists of 20 pupils; in sewing, of 56.

Springfield, Mass.—Industrial drawing was introduced in this system in 1870, and manual training not until 1886. The object of the instruction is to give every-boy in the senior grammar grade, who desires it, one and one-half hours' practice a week with tools, and to give daily lessons throughout a three years' course, to such high school pupils as elect to take it, in wood and metal work and mechanical drawing. When the high school department shall have been established the pupils of the literary department are to be taken in classes, each of twelve, and to be given one and one-half hours of shop practice and three-fourths of an hour in drawing for five days of the week.

The work is in carpentry and wood turning, under one instructor. The pupils, 126 in all, are divided into classes of twelve. The grammar grade pupils, 62, receive one lesson a week, the high school pupils, 26, receive two shop lessons and one in drawing. There is also a class (divided, perhaps, into several classes) composed of 38 teachers, which receives instruction once a week in the shop. The pupils leave their building to receive the instruction, which is equally divided between carpentry and turning.

The cost of the plant was \$500. The salary of the instructor is \$1,200; the cost of the materials for the year was \$188, of new tools and repairs, \$806, and of incidentals, \$118.

Winchester, Mass.—Industrial drawing was introduced into this system in 1872 and manual training in 1887. At present only sewing and carpentry have been introduced.

For each of the two subjects there is an instructor. Two hundred and fifty boys and girls are instructed in sewing, in lessons of 45 minutes each. In carpentry a class of 15 boys are instructed for one hour, leaving their building. Sewing is taught to the pupils of the fourth, fifth, and sixth grades, carpentry in the eighth and ninth. The sewing classes are either 20 or 40.

The plant cost \$150. The amount paid teachers during the year was \$300, and the cost of material was \$100.

Minneapolis, Minn.—Manual training followed the introduction of industrial drawing in this city after a lapse of nine years. The work is closely connected with the public school system, and is considered as an integral part of it. The work in wood is confined to the high school, while sewing, moulding, and modelling are confined to the lower grades.

There are five instructors and 150 pupils in wood-work, receiving a lesson each school day during the week. The sewing classes receive two lessons weekly, the moulding and modelling classes but one; the classes are composed of from 15 to 20 pupils. Pupils do not leave their building.

No financial statistics are given. The system has a high school course of manual training now confined to wood-working, but metal work is soon to be added. This would have caused the statistics of the wood-working department to have been placed in the tables dealing with manual training schools had they been sufficiently full.

Stillwater, Minn.—In the high school shop the manual training is conducted according to Goss's "Bench Work," and in lower grades according to Thompson's "Manual."

The work in the high school is under one instructor and is given to classes of six, daily for one hour. In lower grades regular teachers give the instruction under the head of "general lessons" once a week. In neither case are pupils required to leave their building.

The cost of introducing was about \$300.

Concord, N. H.—Industrial drawing and manual training appear to have been simultaneously introduced into the city system. The school of carpentry which has been established, other forms to be added soon, will accommodate 100 pupils.

The classes, of ten pupils each, each receive one lesson a week, continuing for two and one-half hours, the pupils leaving the building in which they are instructed in other branches. The work is under one instructor, and is pursued by 100 pupils.

The cost of the outfit for this instruction was \$500. The salary of the teacher was \$700; the cost of the materials used during the year, \$150; of new tools and repairs, \$100; of incidentals, \$50.

In addition to the above statistics furnished by Superintendent Rundlett, the office is in receipt of information respecting the work of school since its foundation given by Mr. Geo. O. Cross, of Concord, to the following effect:

Although the school year has 36 weeks, the average attendance of the pupils at the manual training school is about 64 hours for the year. The school was opened January 31, 1887, with 59 pupils the first week; average attendance for the first 16 weeks, 67. In September, 1888, it opened with 77 and closed with 85. The statistics above are for the year beginning September, 1888.

Hoboken, N. J.—The citizens of Hoboken have raised \$4,079 for "industrial education," thus securing a like amount from the State, in accordance with the law which

provided that any locality raising \$3,000 or more could obtain an equal amount from the State treasury. A sewing teacher has been employed and has under her instruction between six and seven hundred girls. The industrial association, having charge of this matter, intends to provide shops in which two or three trades for boys are to be taught. The shops will be located in a central part of the city, and will be "separate from the public schools," beginning work in October, 1888. At a meeting of the trustees of the industrial association, May 28, the following curriculum was decided upon for the ensuing school year: (1.) To continue the teaching of graded lessons in plain sewing in five public schools, where 600 pupils are now taught. (2.) To teach graded lessons in embroidery, each Saturday, to a class composed of high school pupils. (3.) To teach cooking, in lessons of an hour and a half each day, at 4 p. m., and to select pupils from the public and other schools. (4.) To teach wood-work to the boys of the four high classes of the grammar and other schools, two lessons a week, and to give such pupils lessons in mechanical drawing.

Mont Clair, N. J.—This town was among the first to adopt manual training, having introduced it in 1882, ten years subsequent to the introduction of industrial drawing. The aim is discipline. The instruction is confined to the pupils below the high school. This instruction consists (1) of drawing, cutting geometric forms in pasteboard, (2) clay modelling, (3) use of carpenters' tools, (4) wood-carving, (5) needle-work. Drawing is taught in all grades, and kindergarten occupations below the sixth year.

The shop-work is under one instructor, who has under him 40 boys drawn from the 7th grade and divided into two classes, each class receiving two lessons a week of one hour. The workshop is situated in the attic of the school-house. Cutting geometric forms in pasteboard is taught in the sixth year to 40 pupils, clay modelling to 40 pupils of the seventh year, wood-carving to 35 in the eighth year, needle-work to 115 in the sixth, seventh, and eighth years. Drawing, taught in all grades, is given to 700. Two lessons are given a week, the lesson continuing for one hour. The classes vary in size from 15 to 25. In cutting geometric forms, clay-modelling, and wood-carving there are two classes for each subject; in drawing there are 16 classes, and in sewing 6.

The cost of the outfit for this instruction was \$350. The teacher was paid \$450. The other school expenses cannot be separated from the gross expenditure for the schools.

Paterson, N. J.—"The special characteristics of the system are that the branches are intended to develop thought while training the hand, hand and brain being co-laborers." The training, as also industrial drawing, was introduced in 1887. The branches taught are drawing, mechanical and industrial; wood-working, on the basis of "working drawings"; clay moulding, sewing, and kindergarten work preparatory to all.

There are two instructors in drawing and one for wood-working. The regular teachers teach all else. Drawing is taught in all grades; in the high school mechanical drawing is taken up. Wood-working is followed by the grammar and high school pupils, who are instructed in classes of about 24, the 378 pupils being formed into 16 classes. Sewing is taught in grammar and high school grades. Pupils in the shopwork leave the building to receive their lesson. The pupils who receive manual training in their seats number 7,913.

The cost of the equipment was \$198. The teachers were paid \$940. Materials used during the year cost \$440; new tools and repairs, \$424; rent, \$38; janitor, \$45, and incidentals \$38.

Albany, N. Y.—In October, 1887, the board of education adopted resolutions to the effect that (1) it is expedient and advisable that manual training be added as a part of the course of instruction in our public schools, and (2) for the purpose of giving the new system a fair trial in the most economical manner possible, one of the rooms in the basement of the high school building be fitted up as a wood-working shop, that a competent instructor be employed to teach the boys in attendance at the high school in the proper use of wood-working tools for a period of one year, the total cost not exceeding \$1,500.

Though manual training has just been introduced, industrial drawing has been taught since 1876. The work is in carpentry or wood-working, as it is indifferently called, and is confined to the high school pupils, the shop being in the building.

There is a single instructor giving lessons to 250 boys divided into classes of 24. Two lessons are given a week, continuing for 40 minutes each.

The equipment cost \$600. The teacher is paid \$800 annually. During the year \$175 were expended for materials, \$10 for new tools and repairs, and \$15 for incidentals.

Jamestown, N. Y.—All the pupils in the primary and secondary receive daily instructions in the use of their hands, training them to become skilful in various employments. In the grammar and high schools a course of instruction is pursued by as many young ladies as can be accommodated at present, numbering about 250 during the year. The boys and men receive instruction and learn how to use various implements in the department of mechanic arts. In the printing office both boys and girls learn to set type and to do other kinds of work to be learned therein.

Newburg, N. Y.—Industrial drawing, introduced in 1880, was followed by manual training in 1886. The matters of instructions are carpentry and sewing. The carpentry instruction now extends over a three years' course, but will be continued through a fourth year.

There are two instructors, one for each of the two subjects taught. The eight classes in carpentry are composed of pupils, 12 to 16 in a class, drawn from the seventh, eighth, ninth, and tenth years. Each class receives one lesson a week, continuing for two and a half to three hours. The pupils of these classes leave their building to receive their instruction. In sewing there are 20 classes, composed of from 20 to 25 pupils, each class receiving an hour's instruction during the week. In carpentry there are in all 101 pupils; in sewing, 434. Drawing is taught in all grades.

The cost of the equipment was \$705. During the year \$1,400 was paid: For teachers' salaries, \$479; for materials used, \$479; for new tools and repairs, \$1,080; for incidentals, \$99.

New York, N. Y.—Drawing was introduced in 1875, manual training in February, 1888. The subjects of study are classified as "form and drawing" (cutting and modelling is covered by the word form), wood-working, sewing, and cooking. Form and drawing are taught in all grades, wood-working in the 5 highest grammar grades for males, sewing in the highest three primary grades and 5 lowest grammar grades for females, sewing in the two grammar grades next above the highest sewing grade. Pupils do not leave their building.

In "form and drawing" every class teacher is a manual training teacher also. In wood-working there are two teachers, in sewing four, and in cooking two. In "form and drawing" there are 6,176 pupils, in wood-working 398, in sewing 1,919, in cooking 311.

In "form and drawing" the pupils of the primary grades receive 4 or 5 lessons a week for 20 or 30 minutes weekly; in the grammar grades the number of lessons varies, the time in grades 1 to 5 is 2 hours weekly, in grades 6 to 8, 1½ hours. In wood-working the time given by the grammar grades is 2 hours a week, number of lessons varying. In sewing the primary and grammar grades have 1 lesson of an hour, weekly. In cooking 1 lesson of an hour is given to the grammar grade, as above described.

No specified number is required in any class, but in grammar schools classes must average 35 pupils to a teacher; in primary schools, 50. In "form and drawing" there are 155 classes; in wood-work, 15; sewing, 65; cooking, 10.

The cost of the outfit was \$4,509; for teaching, \$1,491; for materials, \$3,075; for incidentals, \$301.

The reader is referred to the course in the schools of the city in which manual training has been introduced, p. 853.

Cleveland, Ohio.—Statistics of the manual training schools are given on p. 898; information as to the cooking school will be inserted here.

In the fall of 1884 a kitchen garden was opened by several young ladies in the basement of a church. The attendance rapidly increasing the Cleveland Domestic Training Association was formed, and in February, 1887, a cooking class was inaugurated, and, with the permission of the board of education, fifty girls from one of the public schools received lessons at the school. In September, 1887, the cooking department of the association became a regular branch of the Cleveland Manual Training School. "A sum of money was set aside to defray the expenses of teaching a certain number of pupils from the city public schools," and by this arrangement 421 girls each received ten lessons free of cost."

"This enterprise," says the superintendent, "opens up a field of very great interest, second to none in practical importance." The aim is to teach plain cooking. The pupils instructed at the school, practice what they have been taught at home.

Meadville, Pa.—Manual training was introduced into this system about three years ago. In the first and second years of the instruction the work consists of (1) modelling in clay geometric solids and common objects based upon those forms as types; (2) stick-laying to represent common objects in two dimensions; (3) paper folding and paper cutting, etc.; (4) tablet-laying as an introduction to designing; (5) drawing, to show facts represented by sticks, tablets, etc. In the third and succeeding years drawing is taught in its three departments—representation of form, decoration of form or designing, facts of form or the making of working drawings. In making designs pupils are required not only to draw the design but to cut the units from colored paper and to arrange these units so as to form the design in harmonizing colors. Every pupil is encouraged to make every object for which he has a working drawing in any material that may be convenient. The work of construction is done at home.

The instruction in its several forms is given by the regular teachers to the pupils at their desks, all pupils being taught three times a week in lessons of 30 minutes each. A special teacher instructs the regular teachers.

The cost of introducing was \$90; of materials used during the year, \$50. The special teacher received \$350 for his service.

New Brighton, Pa.—Industrial drawing was introduced in 1881, followed in 1886 by manual training. The instruction given is in sewing and wood-working.

There is a teacher for each subject of manual training, while in drawing the instruction is given by the regular teachers. In sewing and wood-working there are two classes for each subject composed of grammar-grade pupils, a class being made up of 25. Each class receives two lessons a week, the lesson continuing for 70 minutes. The pupils do not leave their building.

The cost of introducing plant was \$500; for teachers' salaries \$400 were expended, and for incidentals, materials, etc., \$100.

Pittsburg, Pa.—Industrial drawing was introduced in 1880, but as yet the matter of manual training adopted has been cooking, introduced during the year under review.

The instruction is given to pupils of the sixth year of school life, the pupils leaving their building to receive it. There are five classes each week of 15 each, for ten weeks. The number receiving the training during the year was 300.

The cost of introducing the subject was \$500; the salary of the teacher, \$1,100; of the material used, \$200.

Tidioute, Pa.—Manual training preceded industrial drawing, introduced in 1887, by two years. The subjects taught are drawing, free-hand and mechanical; Sloyd carpentry and lathe work; forging; floriculture; and sewing.

For carpentry, wood turning, mechanical drawing, and sewing there are special teachers. The three carpentry classes are composed of ten each, receiving three lessons of an hour each week, the pupils leaving their building. In wood turning there are two classes of four pupils each, instructed three times a week for one hour. In sewing there are five classes of twenty each, instructed twice a week for one hour. In mechanical drawing there are three classes of ten each, instructed twice a week for one hour. Free-hand drawing and floriculture are taught in all grades. Lathe work and mechanical drawing is confined to the high school grade, and carpentry and sewing to the intermediate and grammar grades.

The cost of the equipment was about \$2,000; for instructors during the year, \$900; for materials, \$200; for new tools and repairs, \$500; for incidentals, \$50.

Knoxville, Tenn.—Manual training and industrial drawing have just been introduced. The features are a kitchengarden, carpenter shop, printing shop, a cooking and a sewing school.

For carpentry, printing, and sewing there is 1 teacher respectively; for cooking and house-work, 2. In carpentry there are 50 pupils, in printing 50, in sewing 105, and in cooking and house-work the same number. Two hours each week are devoted to these studies, which are given to pupils of the first, fifth, and sixth grades, they not leaving their building. About 25 form a class, and there are two classes in each subject.

The cost of teachers during the year was \$1,447; of materials, \$115; of tools and repairs, \$199, and incidentals, \$361.

It is contemplated to extend the training throughout the system.

Eau Claire, Wis.—Industrial drawing was introduced in 1879 and manual training in 1884. The features of the course are carpentry work, blacksmithing, and wood turning. Principal McGregor characterizes the work as purely educational, nothing in the shape of trade teaching being attempted.

Each subject has an instructor. In carpentry there are 46 pupils taught in three classes; in blacksmithing there are 12 pupils forming two classes; and in wood-turning there are 8 pupils forming two classes. Each class receives two lessons a week, each lesson running for one and a half hours. The work is voluntary and pupils are admitted from the grammar or high school grades, and pursue the course in the following order: Carpentry, blacksmithing, and wood turning. They, of course, are obliged to leave their building to receive the instruction.

The cost of introduction was \$325; during the year \$720 was paid for teachers, \$30 for material, \$10 for new tools, and repairs and incidentals, \$5.

La Crosse, Wis.—Industrial drawing was introduced in 1884, manual training in 1886. The instruction takes the form of clay modelling, cutting and folding paper into various geometric forms, and making simple articles in wood. The latter work is optional, however. All the schools below the high school have training in the several subjects above mentioned.

B.—STATISTICS OF MANUAL TRAINING SCHOOLS.

THE IMPERIAL TECHNICAL SCHOOL OF MOSCOW.

"When the mariner," says Mr. Webster, "has been tossed for many days in thick weather and in an unknown sea, he naturally avails himself of the first pause in the storm, the earliest glance of the sun, to take his latitude and ascertain how far the elements have driven him from his true course." Before "imitating this prudence," and referring to the point from which the Russian system departed to proselyte America, let us hope that our endeavor will not be disposed of by saying, in the language of one of

Molière's physicians, "That was so; but we have changed all that, and now practice medicine in an entirely different fashion." The claim as to the educative character of the instruction at the manual training school is implicitly respected; indeed, how would it be possible to go wrong when Professor Woodward, in his "Manual Training School," expressly tells us that "Mr. Runkle looked deeper into the problem than had Della-Vos; he saw that shop instruction, essential to a mechanical engineer, had elements of value in a general education."

"This school, [the one of which we are speaking]," says Professor Runkle, in 1877, "is entitled to the leading place in any list of schools given mechanic art education, on account of the fact that it was the first to put this instruction upon a strictly scientific and educational basis—first, by separating the laboratories or instruction shops from the manufacturing establishment, and second, by working out a systematic scheme of instruction in each of the underlying arts."

The same authority describes the school under four heads—Organization, Administration, Method of Instruction in the Mechanic Arts, School Workshops. With the administration we are not concerned. The method of instruction, which is a quotation from a description by Director Della-Vos, has been given for the most part on page 829, and we will, therefore, devote our attention exclusively to what is required of the student before he is admitted, and the character and purpose of the instruction of the school, both of which constitute the head "Organization."

The old school of arts and trades founded in 1830 having been reorganized in 1868, the date of this school's rank as the leading polytechnic school of Europe began then. The course of instruction is of six years, three of which are given to theory (the instruction being the same as in the leading polytechnic schools of Europe) and practice—free-hand and mechanical drawing, the art of turning in wood and metals, joinery and pattern-making, fitting, locksmithing, forging, moulding, and casting. For these practical studies special shops have been provided with all the pedagogical objects necessary to demonstrate the fundamental principles of handwork in the mechanic arts.

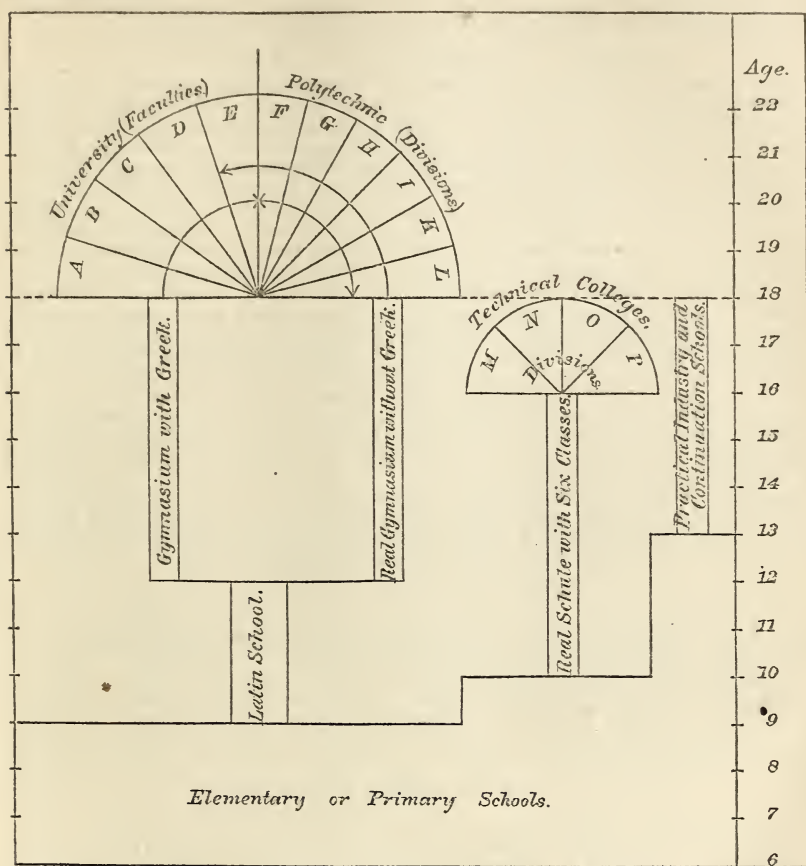

The question naturally occurs, What is the intellectual maturity (the literary maturity, as the advocates of manual training might prefer to say) of the candidate for admission? Before an applicant is admitted he must present presumptive evidence of qualification by presenting one of the following certificates: (1) A certificate of the seventh (the highest) class of a gymnasium, a college whose instruction is distinctively Latin and Greek; or (2) a certificate of having completed a course in a realschule of the first class, about equal to our Latin-scientific course in an ordinary college. Before being definitely admitted, however, the applicant must pass a test examination in the following subjects: Russian language; composition, on a theme chosen "by the professor;" mathematics, arithmetical, algebra, elementary analysis, geometry, and plane trigonometry, physics, and drawing. If he has neither of the certificates of academic grade he must pass an examination on all the studies of a realschule of the first class. In brief, the applicant, before he can enter the Russian school, must have undergone a course of literary training perhaps equal to the course of an ordinary American college.¹ The following diagram,

¹ The Russian "Gymnasium" (and "Gymnasium without Greek") has the aim, says the law of July 30, 1871, to give its pupils, on the one hand, a general education, and on the other to prepare them for [one of the faculties that compose] the "university" [of Continental Europe], or for other "higher institutions." The course consisted [sec. 2 of the law of 1871] of seven classes, six of which were of a year each and the seventh of two years. In 1877 a new programme was established with eight classes, but it is thought that Professor Runkle refers to the 1864 programme as modified in 1871. This programme reads as follows:

Studies.	Class.							Lessons.	Hours.
	I.	II.	III.	IV.	V.	VI.	VII.		
Religion.....	2	2	2	2	2	2	2	14	17.5
Russian.....	4	4	3	4	3	3	3	24	30
Latin.....	4	5	5	5	5	5	5	34	42.5
Greek.....			3	3	6	6	6	24	30
French or German.....	3	3	2	3	3	3	2	19	23.75
Mathematics.....	3	3	3	3	3	3	4	22	27.5
History.....			2	3	3	3	3	14	17.5
Geography.....	2	2	2	2				8	10
Natural history.....	2	2	2					6	7.5
Physics and cosmography.....					2	2	2	6	7.5
Writing.....	4	4	3	2				13	16.25
Total lessons and time.....	24	25	27	27	27	27	27	184	230

The Gymnasium without Greek divided the time thus gained between Latin, French, and German.

taken from a work by the competent hand of Sir Philip Magnus¹ and published by the New York Industrial Education Association, will illustrate the meaning of this better than description:

UNIVERSITY FACULTIES.

- A—Theology.
- B—Jurisprudence.
- C—Cameralistic.
- D—Medicine.
- E—Philosophy.

POLYTECHNIC DIVISIONS.

- F—General.
- G—Engineering.
- H—Architecture.
- I—Mechanics.
- K—Chemistry.
- L—Agriculture.

TECHNICAL COLLEGE DIVISIONS.

- M—Mechanics.
- N—Chemistry.
- O—Building.
- P—Commerce.

Now, to what does this course lead? What is the second course of three years? "The work of the second three years," says Professor Runkle, "embraces three sections of students, mechanical engineers. There is a fourth section, called *praticiens*, formed exclusively of those who show exceptional aptitude for practical work, but whose theoretical studies are insufficient to pass them into the engineering sections. They take much fuller shop courses, which they complete in three years.

In addition to the school shops, "the school possesses large manufacturing works with all the adjuncts of a first-class establishment. These works employ salaried workmen, and execute orders annually to the amount of a hundred and fifty to two hundred thousand francs. Still, the main aim of the work is to furnish students an example of the conditions of industrial work in all its practical details."

¹ Education in Bavaria. Published by the New York Industrial Association as one of a series of monographs in which living issues are not only discussed, but discussed in a manner worthy of their importance.

Such is the first course of three years of the Moscow institution, and such its environment, we think, that it will not be disputed that it is merely a scientifically arranged preparatory school to the upper course, and that its students have considerable literary acquirements before beginning it. But before considering our manual training schools we will consider the secondary professional schools of Germany and France.

THE SPECIAL PROFESSIONAL SCHOOLS OF GERMANY.

"In Germany," says Inspector General Jost, in a report to his chief, the French minister of public instruction,¹ "the greater number of professional schools have a special character, as the name, *Gewerbliche Fachschulen* (special professional schools), by which, as a class, they are known, indicates. In these schools the object, speaking generally, is to give not only a general theoretical and practical course of instruction to their students, a certain aptitude in all the manual professions, but to make specialists of them by instructing them in the predominating industry or industries of the locality in which the particular school is situated." At Cologne, for instance, an industrial centre and large city, the students are prepared for the professions that relate to building construction, furnishing, ornamenting, etc.; at Bochum, a town situated among the mines of the Berg country, metallurgists and superintendents of mines are educated; at Remscheid, a centre of small iron and steelware industries, it is sought to make expert mechanics in articles of hardware; at Höhr-Grenzhausen, a region of pottery manufacture, a school of ceramics has been established. "Speaking generally," continues M. Jost, "it is proper to say that the young man leaves the elementary schools when fourteen years of age [before which age he cannot gain admittance into the professional school]; that he works during two years in a shop either before or after his course at the professional school, in which he remains also for two years; so that he is not a workman until his eighteenth year, when he is sufficiently mature and advanced to complete his technical education by himself."

It is very observable how business-like these methods are. The locality has a specific industry and a school whose specific object is to educate workmen to follow that industry; while the school work is either immediately preceded or followed by real work. The field of the apprentice's activity is narrowed to the subject in hand.

APPRENTICE SCHOOLS OF FRANCE.

We have already spoken of the work done in the public schools of France, upper and lower grades. Apprenticeschools, distinctively known as such, will now be noticed. Consul Schoenhop's very recent work will again be used.

"A number of schools have been created whose object is to supply boys leaving the public schools with a higher elementary education and at the same time give them instruction in special branches of manufacture and industrial art. This has become necessary in consequence of the modern development of industries, whose minute subdivision into special branches and departments make it more and more difficult for a boy to become more than a maker of a part of anything, seldom getting a notion of the whole finished article in any special trade." * * * One of the best of this kind that I have had the pleasure of visiting is The École Municipale Diderot, Boulevard de la Villette.

"This school was created in 1873. The director, M. Jules Bocquet, a civil engineer, has also been a pioneer in this branch of instruction, and has devoted most of his life to the propagation of his views upon technical education. * * * The pupils are graduates from the common schools, and belong mostly to the working classes. The best proof of the high value of the school and the high credit which it obtains is that the municipality has decided to establish several schools of the same character in Paris.

"The course of instruction in this school occupies three years, and is divided into theoretical and practical part. The theoretical part of instruction comprises for the—

"*First year.*—French grammar, orthography, arithmetic, geometry, elements of general chemistry, elements of physics, general properties of bodies, technology, materials, their properties and uses; hand tools; general history up to modern times; geography, commercial and industrial; geometrical and ordinary drawing.

"*Second year* comprises French composition, arithmetic, geometry, measure of surfaces, surveying, and levelling, industrial chemistry, metallurgy, industrial physics, technology; the different organic elements of machines and process of their manufacture, elements of machine construction, history, geography, commercial and industrial; drawing from models and machine drawings from sketches taken from the professor's demonstration in the recitation-room, and geometrical drawing.

"*Third year.*—Reports on observations made in workshops and factories visited; mechanics, algebra, trigonometry, elements of geometry and space, physics, chemistry, technology, description of machines, steam and other motors, resistance of materials, designing of tools, machine sketches at sight from models and black-board illustrations; geometrical drawing, accounting, book-keeping, and political economy.

"The theoretical studies take four hours each day for the first two years. The workshop practice, however, is six hours a day for the first two years, and eight hours for

¹ Notes sur quelques écoles professionnelles d'Allemagne. Mémoires et documents scolaires, publiés par le Musée Pédagogique, Fascicule No. 14. Paris, 1887.

the third year, with pauses between for meals and recreation. Besides this, there is a military drill every Sunday and Thursday morning from 8 until 10.30 o'clock.

"Workshop practice proper.—The pupils must have passed their thirteenth year when they are admitted to the apprentice school and be in possession of a certificate of primary education. During the first year the apprentices pass in succession through the various branches carried on in the establishment. They make a trial of each of them in order to become acquainted with the general character of manual work before adopting the particular trade best adapted to the temperament and aptitudes of each individual. After the first trial year the pupil, guided by the director of the workshop, chooses the trade he will devote himself to during his apprenticeship, in which the next two years are passed.

"The workshop practice is divided into the following branches:

"Metals, blacksmithing, turning, fitting, locksmithing, and philosophical instrument making.

"Modelling in clay.

"Wood-work, joiners' work, wood-turning, and model-making."

"First year.—The first year's practice is given to all boys alike, and they work their way through the different branches gradually, so as to find out their particular fitness for one or the other trade.

"Second and third years.—Wood-work, furniture-making and model-making, modelling, iron-work, forging of machine pieces of more complicated nature; setting and mounting machines and tools; small machinery, blacksmithing and artistic-hammered iron-work. Philosophical-instrument making is conducted in a special apprentice school."

THE MANUAL TRAINING SCHOOL.

Nothing is more frequently affirmed of the manual training school on the American system than the phrase "We do not teach a trade," to which is not infrequently added, "but the underlying principles of all trades." By consulting the course of study of the American manual training school given below,¹ it will be seen that though the technical courses are similar the literary character of the programme of the American school is, to say the most, at the end what the Russian school requires at the beginning of the course; and that the American course is a hybrid, being the English studies of a high school and the preparatory technical course of the Russian school. But it will be observed that the French apprentice school, distinctively known as such, also has a preparatory course, a year of observation, before the pupil selects a trade to follow for the two remaining years. In which of these acceptations is the phrase "we do not teach a trade" to be taken? Does it mean a preparation for a higher course as at Moscow, or a three years' course of observation, or does it turn out the boy, unlike the public schools, ready to make a living though no trade has been taught him? In short, what is the positive of this nega-

¹ COURSE OF STUDY OF THE ST. LOUIS MANUAL TRAINING SCHOOL extends through three years. Except in the literary work no choice of subjects is allowed. All must be taken in regular order as laid down below:

First year.

Arithmetic completed; algebra to equations.
English language, its structure and use; study of selected pieces; history of the United States.
Latin grammar and reader may be taken in place of English.
All students have English composition once a week.
Huxley's Introduction to Science; physical geography; botany.
Drawing, mechanical and free-hand; penmanship.
Carpentry and joinery; wood-carving; wood-turning.

Second year.

Algebra through quadratics; geometry begun.
Natural philosophy; experimental work in the physical laboratory.
English composition and literature; rhetoric; English history.
Latin (Cæsar) may be taken in the place of English and history.
Drawing: Line-shading and tinting; machines; development of surfaces, free-hand detail drawing, isometric projections.
Forging: Drawing, upsetting, bending, punching, welding, tempering; pattern-making, moulding, soldering.

Third year.

Geometry, plane and solid; mensuration.
English composition and literature; history; elementary political economy, and civics; graduation essay.

French may be taken in place of English and history, or in the place of science study.

Physiology; elements of chemistry. Students who have taken Latin, and who intend to enter the polytechnic school after completing the course in this school, take history and rhetoric in place of physiology and chemistry.

Book-keeping.

Drawing: Brush-shading, shadows, geometrical and architectural. An elaborate finished drawing closes the course.

Work in the machine-shop: Bench work and fitting, turning, drilling, planing, screw-cutting, etc. The making of a project.

tive definition, which, when taken in connection with the shop work and the expression "the underlying principles of all trades," still leaves a decided appearance that the great purpose of these schools is to make mechanics by a process, *mutatis mutandis*, similar to that by which good scholars are formed? The reader is referred for an answer to the statements made by their directors, which follow in the order in which the schools were established.

Manual Training School of Washington University.—"Its motto is, 'The cultured mind, the skilful hand.' It is not assumed that every boy who enters this school is to be a mechanic. Some will find that they have no taste for manual arts and will turn into other paths—law, medicine, or literature. Some who develop both natural skill and strong intellectual powers will push on through the polytechnic school into the realms of professional life as engineers and scientists. Others will find their greatest usefulness as well as highest happiness in some branch of mechanical work into which they will readily step when they leave school. All will gain intellectually and morally by their experience in contact with *things*. The grand result will be an increasing interest in manufacturing pursuits, more intelligent mechanics, more successful manufacturers, better lawyers, more skilful physicians, and more useful citizens."

School of Practical Mechanics and Design, Minneapolis, Minn.—"The instruction given is based on the 'Russian system,' in which the leading idea is to teach principles rather than to produce objects of commercial value. It is believed that the greatest progress can be made in a given time with this method, as the student proceeds, by a carefully-planned series of exercises, from the simplest to the most difficult operations, learning the processes, but avoiding the repetition of the ordinary shop. So far as is consistent with this system the work is adapted to parts of some machine or structure in common use, and after finishing the exercises referred to above, the class will build some complete machine or structure, as a review and application of the preceding work."

Manual Training Department of the College of the City of New York.—"The object of the entire course is to furnish the student with such manual skill and such a general knowledge of the tools and methods of working in the arts in which wood and metal are employed as will give him an intelligent comprehension of any mechanical operation or device, and enable him, with proper study and practice, to master any handicraft or mechanical profession to which his attention may be directed in after-life."

Baltimore Manual Training School.—"The school does not teach trades. Its aim is more comprehensive; it lays the foundation for many trades, and at the same time recognizes the value of intellectual discipline. It is not assumed that every boy who enters this school will be a mechanic. * * * This school differs from the city college in omitting from its required studies foreign and ancient languages, in giving prominence to mechanical drawing, and particularly in affording scientific instruction and actual practice in the care and use of tools."

Chicago Manual Training School.—"The special feature of the school in which it differs from the ordinary high school is its manual training. Notwithstanding the prominence given to this part of its course, experience shows that its mathematical and scientific work need not be inferior to that of the best high schools. Education, not manufacture, is the idea underlying the manual training. Consequently, the material products of the shops consist chiefly of exercises designed to develop skill in the use of tools. The educational value of construction is also recognized, and the course embraces a number of finished articles."

Hebrew Technical Institute.—"The school pursues educational methods. Its object is, however, specific, and its promoters hope that all its graduates will enter into industrial avocations. This is the difference between this school and a trade school. A trade school is one where some special branch is taught—a school where cigar-making or plumbing or some special industry is taught. Surely ill-fed boys of twelve and a half or thirteen who never saw a hammer or a chisel are not fit to be set at these trades."

* * * Let them, however, go to a school, not where a trade is taught, but where they are taught to use tools and to draw and to continue their ordinary education, and when they get to be fifteen or so, and then they are not too old to enter life, what have they learned? * * * They have the foundation laid stout and deep; the foundations of intelligence and skill, for they know the principles not of one trade but the principles that underlie many trades."

Manual Training Department of Tulane University.—"Throughout the high school the attempt will be made towards a normal adjustment of that physical, mental, and moral training which is so much praised and so little practiced. The hand, the eye, and the muscle are trained by the handwork in wood and iron, which is now admitted to be the true basis of mechanical education, and is claimed to confer so many benefits. * * * The purpose throughout is *training*. * * * But we do not expect or desire manual training to supersede, or be substituted for, other well-established courses of training sanctioned by the experience of wise and conservative men. Hence the manual train-

ing school is not a separate department of Tulane University, but the laboratory in wood and iron where instruction and practice render the student quick, observant, and accurate with the eye; ready, skilful, and exact with the hand, and able to think in things, as well as about them, and to execute as well as describe."

This school is conducted in the Swedish system. See page 848.

Philadelphia Manual Training School.—"In the Philadelphia Manual Training School are taught the principles applied in the various arts and trades, the principles of pure science, of political economy, of social science, of the mother tongue and its uses, and the lessons of history.

"The school trains boys from 14 to 18 years of age in actual practice to become familiar with elementary notions, and to acquire substantial knowledge of the nature of things and of the character of human society and the rights and duties of men. There are many trades and occupations, but the principles underlying the successful pursuit of any of them are common to the greater number. A manual training school is not a trade school; but it is a school wherein the principles of all trades and occupations are taught. The object of the school, therefore, is the education of all the faculties. The whole boy is put to school; he learns to do by doing. * * * It is not to be supposed that pupils enter the school merely for the purpose of becoming mechanics. * * * Manual training is a means of developing to a high degree certain faculties—such as observation and judgment."

Haisk Manual Training School.—"It is not assumed that every pupil who enters the manual training school is to be a mechanic. * * * All the shop work will be disciplinary. Special trades will not be taught, nor will articles be manufactured for sale. The scope of a single trade is too narrow for educational purposes. Manual education should be as broad and liberal as intellectual. If the object of the shop is education, a student should be allowed to discontinue any task or process the moment he has learned to do it well. * * * In manual education the desired end is the acquirement of skill in the use of tools and materials, and not the production of specific articles; hence, we abstract all the mechanical processes and manual arts and typical tools of the trades and occupations of men, arrange a systematic course of instruction in the same, and then incorporate it in our system of education. Thus, with teaching any one trade, we teach the essential mechanical principles of all."

Cleveland Manual Training School.—"No one," says the city superintendent, "should be misled by the term manual training. Many suppose the object to be simply training the hand—far from it. The training of the mind is as much an essential of this school as it is in the high, grammar, or primary schools. In this the ability of the mind to conceive, plan, and carry out a measure is shown through dexterity in execution. The solutions of problems in mechanical drawing; the reduction of a piece of lumber from its rough into a perfect model; the hammering of a crude piece of iron into a definite shape and size; the adjustment of the several parts of a piece of mechanism, more or less complicated; the study of a complete machine of any kind with reference to the discovery of the general design; the adaptability and specific uses of its various parts, its points of weakness, etc., all this requires the exercise of the mental faculties just as clearly, persistently, and profitably as is required in the study of language, mathematics, or science. It is not proposed that this shall take the place of anything else. It affords a peculiar exercise of the mental faculties which no other study affords or can afford.

"Neither is it intended that any trade shall be taught, as is clearly shown in the course pursued."

The Technical School of Cincinnati.—"The course in this school requires of its students as much application and continuous honest effort as does the course in any academic institution of equal rank. The advantage claimed for its hand training is that it requires thinking. The work is never so long continued that it becomes mechanical or automatic, but is changed so frequently and is varied in its nature so that it requires as much mental effort, although of a different kind, as is required in the study of mathematics or of languages. To guide the hand in its ever varying tasks requires the continuous directive effort of the mind, and results in after-reflection on the degree of success or failure in the work attempted, of disappointment and of plans for overcoming the opposing obstacles, and the tangible results are to show when success at last crowns the efforts of the genuine student. The result of the thinking, the planning, the final overcoming of the difficulties, and the production of the finished project is education in its truest sense, the awakening of dormant faculties, the development of the latent capabilities."

The Department of Mechanic Arts of Pratt Institute.—"It is now generally recognized that manual training is an important and necessary adjunct to the education of the schools, and that mind and eye and hand must together be trained in order to secure symmetrical development. Manual training aims at the broadest, most liberal education. While developing and strengthening the physical powers, it also renders more active and

acute the intellectual facilities, thus enabling the pupil to acquire with greater readiness and to use more advantageously the literary education which should go hand and hand in manual training. * * * The twofold aim of the institute is based on an appreciation of the dignity as well as the value of intelligent handicraft and skilled manual labor. It endeavors to give opportunities for complete and harmonious education, seeking at the same time to establish a system of instruction whereby habits of thrift may be inculcated, to develop those qualities which produce a spirit of self-reliance, and to teach that personal character is of greater consequence than material productions. It offers its advantages only to those who propose to do their own part earnestly and well. Its aim is to aid those who are willing to aid themselves."

CHARACTERISTICS OF AMERICAN MANUAL TRAINING SCHOOLS AND THEIR STATISTICS
FOR 1887-88.

The newness of these schools as a class, and their rapidly increasing number, have caused us to spread before the reader not only their statistics of attendance, but a view of other features not of a numerical nature.

In doing this, condensation has been sought by using the tabular form of presentation, distributing the whole field into departments and devoting a table to each department. This manner of treatment may sacrifice the individuality of a school, but it will promote the comprehension of them all as a class. Whatever is objectionable in it will be rectified in future reports.

Although the class is distinguished by having a high school and a work shop department, it sometimes happens that these are not in the same building. Again, some public schools of this class are completely independent schools, there being another public school in the same system, where the student may pursue the usual secondary course of instruction; while in other systems the work shop department is a division of the single high school that it possesses. These and other minor distinctions make it somewhat difficult to be plain and yet to speak briefly, the only literary virtues open to the statistician, whose subject-matter of discourse is not chosen by poet or novelist, either "to point a moral or adorn a tale."

TABLE 74.—*Manual Training Schools, their Officers and Connection.*

Place.	Name.	Year of Opening.	Director.	Connection.
1	2	3	4	5
1 Denver, Colo.....	Huish Manual Training School.....	1885	H. F. A. Kleinschmidt.....	Department of the Colo. Conference of the Meth. E. Church.
2 Chicago, Ill.....	Chicago Manual Training School.....	1884	Henry H. Belford.....	Owned by the Commercial Club of Chicago.
3 Chicago, Ill.....	Manual Training Department of the Chicago High School.	1886	Herman Hanstein.....	Part of the Public School System of Chicago.
4 New Orleans, La.....	Manual Training Department of Tulane University.	1884	John M. Ordway.....	Part of Tulane University.
5 Baltimore, Md.....	Baltimore Manual Training School.....	1884	John D. Ford, U. S. N.....	Part of Public School System of Baltimore.
6 McDough, Md.....	McDonough Institute.....	1873	William Allan.....	Belongs to the city of Baltimore; but is not a part of the Public School System.
7 Minneapolis, Minn.....	School of Practical Mechanics and Design.....	1883	William A. Pike.....	A department of the College of Medicine Arts of the State University.
8 St. Louis, Mo.....	Manual Training School of Washington University.	1880	C. M. Woodward.....	A separate department of the University, but of lower grade.
9 Omaha, Nebr.....	Manual Training Department of the High School.	1885	Albert H. Bumann.....	A department of the Public High School.
10 Brooklyn, N. Y.....	Department of Mechanic Arts of Pratt Institute.	1887	A department of Pratt Institute, established to promote manual education.
11 New York, N. Y.....	Hebrew Technical Institute.....	1884	H. M. Leipziger.....	Sustained by subscriptions from associations and individuals.
12 New York, N. Y.....	Manual Training Department of the College of the City of New York.	1883	Alexander S. Webb, president of the college.	A department of the College of the City of New York.
13 Cincinnati, Ohio.....	The Technical School of Cincinnati.....	1886	L. R. Klemm.....	Under the auspices of the Technical School Association.
14 Cleveland, Ohio.....	The Cleveland Manual Training School.....	1886	Newton M. Anderson.....	Property and apparatus owned by a private corporation, the running expenses paid by the city.
15 Toledo, Ohio.....	Manual Training School.....	1884	George S. Mills.....	Connected with City High School, which gives the literary instruction.
16 Philadelphia, Pa.....	Manual Training Department of Girard College.	1882	T. Mason Mitchell.....	A department of Girard College.
17 Philadelphia, Pa.....	Philadelphia Manual Training School.....	1885	William L. Sayre.....	Stands in the same relation to the Public School System as the High School does.
18 Crozet, Va.....	The Miller Manual Labor School of Albemarle.....	1878	C. E. Yawter.....	Endowed, self-sustaining, and isolated.

Remarks on Table 74.

It is noticeable that the institutions given in the preceding table are for the most part situated in the Northern or Western States.

As to their connection or source of support these schools may be divided into three classes: Those established by private individuals and supported by endowment or otherwise, with or without tuition; those established by societies and supported by tuition, the society meeting deficiencies; and those established and supported by municipalities or other public authority.

The establishment of an institution of learning by wealthy and philanthropic individuals, or by religious bodies, is far from being unknown here; but the activity of associations in giving concrete expression to their views by founding and protecting institutions which are to prove the practicability of those views, has not been so common. The distinguished origin of the Chicago Manual Training School was given in the report for 1886-87 as springing from the action taken by the Commercial Club of Chicago, and from similar action by the Order of Cincinnati has arisen the Technical School of Cincinnati.¹ The Cleveland Manual Training School is also the result of concerted action, it having been established by a joint stock company formed for the purpose; the running expenses of this school, however, are paid by the city of Cleveland. The Hebrew Technical Institute, of New York City, is another evidence of this activity of associations in promoting manual training.

At Baltimore and Philadelphia complete educational institutions have been established as part of the public school system, remarkable for their completeness of equipment and thoroughness of instruction. At New York City and at Toledo, where in each instance the school is apparently rather a department than a school complete in itself, the school established is also a part of the public system. In all these cities there are also purely literary schools of academic grade, and it will thus appear that there is an option presented to the student. If he wishes to follow an industrial occupation it is certainly more profitable for him to attend the manual training school, and to this obvious reason the advocates of manual training would add more profitable in an educational sense.

At Omaha, Minneapolis, and Chicago, where the schools are departments of the high school of the respective cities, the course has not yet been fully introduced.

Of the several schools which are parts of a university system, it is to be remarked of the St. Louis school that its connection is so loose as to practically amount to independence. The McDonogh Institute and Miller Manual Labor Schools, both well endowed, are included in the table. The latter certainly belongs in this class of schools despite its name and object, which appear to indicate more practical aims than other schools on the Russian type; in a word, the object appears to be to turn out graduates many of whom can "do as good work as the average person does upon the completion of an apprenticeship and know far more of the principles of machinery," etc.

To characterize these schools the phrase "manual training" is used with but few exceptions. In Cincinnati the title adopted is Technological School, while for the manual training department of the State University at Minneapolis the phrase Practical Mechanics and Design has lately been substituted for Artisans' Training School, by which until then it had been designated.

In examining the educational features of these schools there are certain characteristics of their respective curriculums which are common. They require an equal degree of scholarship and physical maturity for admittance, they all give instruction in wood-working, forging, and machine-shop work by a graded course, they all give instruction in drawing and in what may be said to be the "English branches" of an academic course. The Office considers that these, together with the general object of educating the pupils rather than teaching them trades, are the foundation of the classification which has been made.

New schools.—The only new school of the class under review is that known as the Department of Mechanic Arts of Pratt Institute of Brooklyn, unless the Manual Training School of Springfield, Mass., may be said to be new in having moved into new quarters near the high school, an additional instance of the determination with which this training is being made a co-ordinate part of public secondary education.²

The magnificence of the gift and the comprehensiveness of the idea which the donor, Charles Pratt, esq., had in mind when establishing the institution which has received

¹ The Commercial Club of Cincinnati took formal action as a body on the subject of this school in November, 1887 (a number of its members had been interested from the first), and has since borne nearly half the expense of the school.

² It is to be regretted that the statistics of the Springfield School arrived too late for insertion in the tables. In making the course, which has manual training as a component part, Superintendent Balliet informs us that the scientific course of the high school served as a stock upon which the manual course was engrafted. See page 882.

his name will be spoken of somewhat fully in the following pages; it is only required here to give the characteristics of the school or department where instruction is given on the "Russian system." In this school it is designed to accommodate three classes of pupils: Members of the regular three years' course who, in connection with their literary work, are instructed in wood and iron working; pupils in other schools who wish to supplement their studies with some kind of manual work, and finally persons who are employed during the day, but, desiring to learn a mechanic trade or to perfect themselves in the trade in which they are engaged, wish to join the evening classes. The buildings of the institute as a whole may be succinctly described as immense. The main structure on Ryerson street, six stories high, is not devoid of architectural effect, but the shops in the rear on Grand avenue, covering a ground space of 144 by 95 feet, are built with the utmost simplicity, the straight lines so necessary when it is a question of inclosing the greatest space with a given amount of wall and roof, being only broken by the massive chimney which towers high above the fourth story of the buildings containing the shops, an unknown appendage to an educational establishment until recent years. The shop buildings are of three elevations: The main building of four stories, 102 by 37, whose three upper stories are to be used as laboratories, class rooms, etc.; the forge and the foundry rooms, 70 by 60, one story, with ventilating skylights, and a two-story building, 91 by 37, containing the metal-working and wood-working shops on the first and second floors respectively. The building for the trade department is described on page 925.

At Springfield the academic studies are, as usual with this class of institutions, higher mathematics, physics, a foreign language, English, and history. Drawing begins in the "First high school year" with the use of instruments and closes in the third year with brush shading, pen and ink sketching, and finished drawings with full details. In the shop the first year is in wood-working, for which the pupil has been prepared in the grammar grade; forging, moulding, etc., follows of course in the second year, and chipping and filing, planing and drilling, and machine construction complete the course.

A junior or preparatory department was established at the Baltimore school in September, boys from the sixth grade of a grammar school being admitted. One hour a day is devoted to manual work, and forty-five minutes to freehand drawing, the rest of the school day being devoted to the usual school work of their grade. There were 114 boys in this department, December, 1887. They were arranged in three classes denominated E, F, and G, respectively. The course is of two years. In the first year ten lessons in wood-work and ten in sheet metal working are given, the wood-working being the joining of two pieces, and the metal working soldering and making sample tin vessels. In the second year the use of the bracket saw and the foot lathe is taught, and the art of tinning and of joining different metals.

TABLE 75.—Manual Training-Schools, Controlling Bodies, and Method of their Appointment.

Name of School. [Abbreviated.]	Controlling Body.				Officer Directing Work.

a 3 are *ex officio*.

Remarks on Table 75.

The manner of conducting these institutions is no exception to the usual methods adopted for governing public and private institutions. When the school is a part of the public school system it is under the control of the city school authorities for the common schools; when the school is a private establishment it is managed by a body, in most cases, either denominated board of trustees or board of directors. If the school is a part of a university system, its controlling body is the university board; the St. Louis school, as before intimated, is controlled by a special "managing committee," appointed by the university board.

Two schools, those of Toledo and Cleveland, both public schools, call for separate comment by reason of the circumstances connected with their establishment and the influence of those circumstances in the matter of their government.

The estate given by J. W. and Susan Scott and others to found the Toledo University of Arts and Trades being insufficient to carry out the intention of the donors, the university board tendered the property to the city of Toledo, on condition that the city would assume the trust. The conditions having been accepted, the common council established the Toledo University under a board of directors (trustees), of which the first department to be established was the manual training school. The board of directors of the Cleveland school is composed of eight members selected by the corporation owning the property and seven selected by the board of education of the city, the city paying the running expenses.

The title of the officer in charge is, in the greater number of cases, principal; in five instances he is called director. In the case of the Baltimore school the principal is a naval engineer, detailed for special duty by the Secretary of the Navy.

As a rule the membership of the controlling body is large, while the term of service is short. At Philadelphia, Baltimore, and Omaha, and in other cities the subject of manual training is placed under the care of a committee of the public school board. How far the short duration of service is modified by reappointment we cannot say.

In the chapter devoted both training of teachers (p. 411) we have found the president of the Colorado Teachers' Association advising his colleagues that the power of managing his school was in the hands of the teacher, since both the trustees and the public, though disposed to think they know what they want are willing to confess, tacitly at least, their ignorance of the means of attaining it, depending on the teacher for a plan. Is and has it been so in the case of these schools? The discussions of the "Board meeting" and the private conferences preparatory to official action do not appear in the annual catalogue of the institution for obvious reasons, much less may they be made a subject of inquiry by this Office. But having in mind the splendid condition of the schools of St. Louis, of Chicago, and others, and applying the maxim "as is the teacher so is the school," we can run no danger of being criticised as overbold in saying that the directors have a controlling power although they are not "the controlling body." Their limitations are financial rather than arbitrary.

TABLE 76.—*Manual Training Schools, Requirements for Admission, Fees, and Length of Course.*

b Not admitted.

a Three days a week.

Remarks on Table 76.

The uniformity of the literary requirements for admission in schools of this class is remarkable; none, except the Hebrew Technical Institute, will admit a student that is not prepared to enter a high school. Thus the proper elementary foundation of the intending pupil is insured. Fourteen seems to be the age, at least as far as given, at which the applicant is admitted. The Philadelphia School and the Hebrew Technical Institute, however, are exceptions to this, the age being 13 and 12 respectively. These are minimum limits; what the average age of those admitted is we do not know.

In several instances the requirements are somewhat higher than what is usually denoted by "studies of the grammar grade." But it is unprofitable to discuss this, since the important fact is that the pupil, before entering, must have been well grounded in the elements of learning and must have attained to the physical maturity necessary for his future studies; for even where the minimum age is not given it may safely be implied from the literary requirement.

Four schools charge tuition, two of these are attached to a university, and two are conducted under the auspices of societies. At the St. Louis school the cost for the course of three years is \$240; at the Chicago school \$300; at the Tulane University Department, \$150; at the Cincinnati Technical School (course of four years) \$450. Where the schools are public institutions tuition of course is free, the charge at the Cleveland school being for material used. It will be observed that in several instances non-residents attending public schools are charged an annual fee of forty or fifty dollars.

The course of these schools is of three years of about forty weeks each, but at the Cincinnati and the Toledo schools it is of four years, while at the Haish School the period of instruction is reduced to two. At Omaha the full course has not yet been introduced, the work being confined to wood-working;¹ at the Chicago High School only the first and second years wood-working and forging have been introduced.

The normal distribution of time between the two concurrent systems of development is, taking the early schools into consideration, three hours for literary work and three—two for shop work and one for drawing—for manual training. At Tulane University the preponderance is greatly on the side of literary training, while at the School of Practical Mechanics and Design the converse is true. In several instances the manual training is given three times during the week. At the Miller Manual Labor School, where instruction is given in this way, the work continues for five hours, is lumped, as it were. At the Cleveland school there is no literary department, the manual training pupils being drawn from the city high schools. Minor differences are exhibited better by the table than they could be here described.

¹ There are several other systems which have manual training departments in their high schools. See Table 71, Column 6, and p. 890 *et seqq.*

d The course being of four years the plan differs somewhat.*e* Number in course of first and second year courses.

Remarks on Table 77.

The foregoing table is perhaps the most important of the series. By it are intended to be shown not only what is taught, but the equipment for teaching, as to buildings, motive power, and manual training appliances. That drawing is one of the three essential elements of the curriculum of this class of schools, simple inspection of Column 9 of the preceding table will show, and that in these schools it is mechanical or industrial, or both, if these terms be convertible with instrumental drawing and designing, will be at once inferred from the very circumstances of the case. To present the character of the instruction given in the various courses in drawing, were it always possible, would require the insertion in full of such course in each instance, and even then this would only be the quantity of the work required, its quality not being subject to statistical handling. The same remark holds true of the other two divisions of these schools, considering drawing for convenience as separate from the manual training department. Only those features which are common to all can be registered in a synopsis of this kind; peculiar excellencies of a particular school must be subordinate to the presentation of the characteristics of the class.

From Columns 5, 6, and 7 it appears that the three departments of Professor Bain's "Renovated Curriculum"—science, humanities, and the mother tongue—are well represented.¹ Algebra, geometry, and trigonometry, which, with mechanics in some instances, are the subjects embraced by the term "higher mathematics," are essential to the student who desires to enter a superior technological school, and the same may be said of science, of which, however, only the elements are taught. It must be remembered that these are not finishing schools, they neither pretend to turn out workmen, or completely educated men in a scholastic sense. They are preparatory schools, preparing their pupils to begin work in the world as an apprentice or to enter upon a college career, as each may elect or circumstances dictate, and have, as Principal Klemm remarks of his school, "virtually a high school course, minus the dead languages, but plus manual training." But, as appears, foreign languages are not neglected.

At the Miller Manual Labor School and at the St. Louis school Latin is taught. In the case of several of the schools not reporting their curriculum the answers to Column 4 have been assumed. It is scarcely necessary to say the modern language taught is French or German. At the New York City and Girard Colleges Spanish may be taken.

In the preceding pages we have spoken of the American manual training school. In this system of instruction as introduced into this country and typified by the St. Louis and Chicago schools, the instruction in manual training extends through three years, of which the first is confined to working in wood, the second to forging and moulding, and the third to the finer work of the machine-shop. Had the answer to the question, "Is manual training conducted on the Russian System?" been less frequently "not exactly" or "not quite," the heading adopted for Columns 8, 9, and 10 would have been Russian System rather than "The three year plan," which, in the case of the Cincinnati and Toledo schools, is untrue, since they have courses of four years.

In considering the statistics of Columns 8, 9, 10, the constant diminution of the attendance with each year of the course at once attracts attention. In lately established schools this might be explained by the limitations of attendance caused by inadequate accommodations in the higher grades; but such reason will not hold in the case of the St. Louis and Chicago schools, the oldest of the class. An examination of the list of pupils in the catalogues of these schools, where the students are grouped according to the year of study, shows the same fact exhibited by the table. Of the lowest class of 1884-85, consisting of 100, only 63 per cent. were in the third year class of 1886-87 at St. Louis. Of the 77 enrolled in the lowest class of the Chicago school in 1885-86 about 50 per cent. were in the third year class of 1887-88. "About one-half of those who attend the school remain to graduate," says Director Woodward. It would thus appear that the attendance at the schools of this class is subject to the same process of diminution that obtains in other educational institutions. In the Omaha, Minneapolis, and Washington high schools only the first year of the course has as yet been introduced. In the Chicago High School and at the Cincinnati Technical School the last year is still wanting.

The buildings occupied by these schools consist of three or four stories. In cities, where ground is costly this might be readily explained on that score; but it will be observed that the same fact obtains in the case of the Miller Manual Labor School, which is situated on a farm. In several instances it will be noticed that rooms of the high school building are occupied by the manual training department.

The Toledo, Chicago, St. Louis, and Cleveland schools have the most powerful motive power, so far as this is indicated by the capacity of the engine. At the Baltimore school there are three engines.

¹ Education as a Science, chap. xi.

In conclusion, for comparison with the programme of studies of the St. Louis school, given on page 889, the French Écoles Primaires Supérieurs, of which we have spoken at length on page 856, is here given.

COURSE OF STUDY OF THE HIGHER ELEMENTARY SCHOOLS OF FRANCE.

Theoretical branches.

"The following is the course of study prescribed. The subjects of this programme are apportioned over the three years' course, so as to apply in the best way to the requirements of professional instruction.

MORALS.—The principles of morals, duties, and rights of the citizen, elementary principles of political economy.

FRENCH LANGUAGE.—Methodical study of grammar and orthography, etymology, and derivation of words, exercises in style and composition, elements of the history of literature.

WRITING.—Principles and practice of running-hand, round-hand, and commercial handwriting.

HISTORY.—Principal characters of antiquity, history of France up to the present day, development of national institutions, chief epochs of general history (ancient, middle ages, and modern).

GEOGRAPHY.—Physical and political geography of the world, special geography of France (comprising the divisions for administrative purposes), economic geography, map drawing.

MODERN LANGUAGES.—One modern language at least.

MATHEMATICS.—First year: Theoretical and practical arithmetic, first elements of ordinary geometry. Second year: Advanced arithmetic, elements of algebra, plane geometry and its applications. Third and fourth years: Principles of algebra as applied to the solution of simple

equations, the elementary principles of rectilinear trigonometry as applied to the estimation of triangles, elementary principles of solid geometry and their application, the common curves.

ACCOUNTS.—First principles of commerce and account keeping, book-keeping, current accounts bearing interest.

PHYSICS.—The most important phenomena and the principal theories of physics, modern discoveries and the applications of science to daily life.

CHEMISTRY.—Exercises involving the observation and examination of some of the familiar facts introductory to the study of chemistry, the metalloids and the most useful metals, the laws of chemistry, the elements of organic chemistry.

NATURAL HISTORY.—Organs and functions of men and animals, practical study of the principal groups of animals and vegetables, application of hygiene to the local industries, principal facts of geology, and examination of the best known minerals.

SINGING.—Choir, with three parts.

GYMNASTICS.—Exercises with apparatus and military drill.

Professional Instruction.

"The programme of professional instruction in the workshops is apportioned to the three years, as follows, and is in practical operation in a number of schools:

First Year.

[Two hours per day.]

DRAWING AND MODELLING.—Execution of the regular geometric solids of given dimensions from figured sketches.

WORKSHOP TEACHING.—(First period)—Working in wood: A box, a drawing board, a mortise and tenon-joint, a slit and tongue-joint, a joint halved together obliquely, a St. Andrew's cross, various kinds of scarfed joints.

(Second period)—Working in iron: Exercises with the file on an uneven piece of iron. Make rectangular parallelepiped, with a square base of given dimensions; this to be converted into an octagonal prism, then into one with sixteen sides; this to be filed round; then, in the lathe, to turn this into a cylinder of specified diameter, and finally convert it into a hexagonal prism.

(Third period)—Working in wood: Various kinds of dovetail joints, splices, skew-splices, halved together, scarf-halved with dovetail pieces.

(Fourth period)—Working in iron: Tool making, two rules in iron of given dimensions, two plain squares, a pair of callipers, exercises with the lathe and cutting chisel.

Second Year.

[Three hours per day.]

DRAWING AND MODELLING.—Execution in graduated series of ornamental casts composed of elements of solid geometry, arranged systematically; rosettes, etc.

WORK IN THE SHOPS.—(First period)—Working in wood: Mortise and tenon to moulded work, tenon for mitre-joint, mortise and tenon with chamfered dovetail, tongued joint with cross-ties, mortise and tenon for quoins.

(Second period)—Working in iron: An angle out of square, a pair of pointed compasses, a hand vise.

(Third period)—Working in wood: Angle open mortise-joint, slit and tongue joint in two

Second Year—Continued.

thicknesses of stuff, stepped mortise and tenon, square joint of two cylinders, oblique joint of two cylinders, a pair of screw-clamps.

(Fourth period)—Working in iron: Bit pinners, screw-wrench, exercise with the lathe, exercise with the cold chisel.

Third Year.

[Five hours daily the first six months, seven hours the last six.]

DRAWING AND MODELLING.—Elements of architecture, orders and styles, ornaments of the different orders and styles.

Industrial drawing: Theoretical principles of composition and of the arrangement of colors.

General principles of the application of drawing to pottery, to fret cutting in wood and metal, to artistic locksmith's work, and to the ornamental stamping of paper and fabrics.

CHEMISTRY.—Experiments in the laboratory, manipulation, analyses, mode of fixing colors (applied to pottery, stuffs, etc.).

ACCOUNTS.—Industrial account keeping, fixing of a scale of profits, applying the same to the work of tools and machines.

WORK IN THE SHOPS.—(First period)—Working in wood: The making of tools, moulding-block, mitre-block, wood bench-clamp, tenon saw, small hand saw, inlaying saw, a plane, use of the wood lathe.

(Second period)—Working in iron: The making of tools, a pair of steel squares (one of them to be a rim square), a tap wrench, working with the cutting chisel.

(Third period)—Working in wood: The making of tools, a plane, jack plane, square, marking gauge, grooving plane, work with the lathe, model making.

(Fourth period)—Working in iron: Making a shifting gauge, working at the forge, elementary work, making of tools, chisels, cross-cut chisels, boring bits, etc., working at the lathe and with the cutting chisel.

a Reported as 330.*b* Of these one is a lady.*c* Of these three are ladies.*d* Of these two are ladies.*Remarks on Table 78.*

The above table contains the statistics that have been given in these reports for several years. Although the facts as tabulated are purely numerical, an examination of the several columns shows that other facts may be inferred. It is perfectly obvious that the corps of instructors in these schools is composed of men. This was, of course, to be expected in the manual training, perhaps even in the literary departments, but it will be observed that the fact holds in the case of drawing. Examining the statistics of enrollment the male element is found to far surpass the female. The query here, however, is, Why should there be any females in schools conducted on the Russian system? In the case of the School of Practical Mechanics and Design it is inferred that the young ladies in the school are following the course in design and wood carving, in which "the instruction in wood carving advances in parallel lines with original design—from its first rudiments to the most elaborate work—with a view to developing the eye, the hand, and the imagination at the same time." At the Omaha School the girls have until recently been admitted, while at the Toledo School a separate department, in which cooking and sewing is given, has been instituted.

In considering the columns in which are given the number of instructors, teaching what may be called literary subjects, the distinction between the manual training school as a department of an educational institution, only a part of whose students are taking the manual training course, and the manual training school proper, where every student of the literary department is also a student in the shops, must be kept in mind. The only seeming exaggeration as to the literary faculty is in the case of Tulane University Department, and the Office is not prepared to say that even in this case it is more than a probability.

Several schools do not answer the inquiry, notably the Cleveland School, the principal remarking that nothing but manual training, including drawing, is taught in that school. While this may impair the accuracy of a total of the number of instructors in the literary department, it has no influence on the individual statements of the manual training schools proper.

In manual training schools pure and simple, as, for instance, the private school at Chicago and the public one at Philadelphia, the literary faculty varies from four to six in number. This teaching corps has a teacher or a professor of science (chemistry and physics); of mathematics, to which is attached another subject; and of English and history. But the lines are not strictly drawn and mathematics are united with English, with physics, or with physiology, according to the school. At the St. Louis School a somewhat different arrangement of the literary faculty obtains. Here the third year class, the highest, is in charge of an "assistant" to the director, who has himself an assistant. The second and first year classes are also, respectively, in charge of an assistant to the director, and all these gentlemen, it would appear, are aided by an assistant in physics, and by another, a lady, in language and history.

The statistics of the teaching force of the manual training department are not liable to the objection that can be made against a total of the literary corps of instructors as given in the table. It appears that there were 32 instructors of drawing in these schools and departments, all men with one exception. In six schools it appears from the catalogues that one at least of the drawing teachers of each school had other duties to perform.

In the workshops of these schools there are 62 instructors, excluding five female teachers. These teachers are known as "Instructors;" instructors in wood-work, in iron-work or metal shop, etc. In general there is an instructor for each of the departments—wood-working, foundry, iron-working, and machine construction and finishing. In several instances the instructor of the wood-working department has an assistant or colleague. At the Chicago Manual Training School the wood-working department, the forge and foundry, and the machine shop have each an instructor, he of the wood-working shop having an assistant. At the Tulane Department there are two instructors in "wood working," one in "iron-working," and one in "machine construction." The Baltimore school has an instructor of "carpentry and wood-turning," another, in the same department, of "pattern-making and moulding;" one of "forge and sheet-metal work," and, in the same department, another for "machine-shop work and finishing." It would appear from this the Baltimore has two departments—wood and metal working. At the school of Practical Mechanics and Design there is an instructor in "metal-work," and two others in "mechanical engineering." At St. Louis there is an instructor in "wood-work," another in "forging," a third in "iron-work," and over all a superintendent. At Cincinnati there is a teacher who is in both the literary and shop departments. One of the teachers of drawing is also a shop instructor, there being but one instructor whose time is wholly devoted to the manual training given. At Philadelphia there is an instructor of "wood-work," one of "smithing and foundry" work, one of "metal work," a fourth of "mechanical construction." At Girard College there are instructors in "carpentry," in "wood-turning," in "foundry and forge," and in "iron-work."

The Office has quoted the specific part of the designation of the members of the several corps of the manual training departments, fearing to generalize and say that the work carried on in these schools amounted to about the same thing and was subject to the simple division adopted by the Chicago Manual Training School—wood-shop, forge and foundry, and machine shop.

It would be interesting to know the social strata from which these schools have drawn their pupils and the vocations followed by these after graduating. As to the first matter there is no room for doubt as to the condition from which the philanthropy of a Girard, a Miller, or a McDonogh has lifted the friendless and poverty-stricken youth of the district, for which each has caused a school to be established; these schools are specifically for "poor boys."

At the recently founded Pratt Institute "it will be the endeavor to make possible by some means consistent with self-helpfulness and self-respect the admission of every worthy applicant." One of the conditions of admission to the Hebrew Technical Institute is that the child be poor.

These institutions, with the exception of that established by Mr. Pratt, are eleemosynary; their wards are too young when admitted to have the feeling of honorable independence that Mr. Pratt would inculcate or sustain.

But these private and public schools as a class are by no means eleemosynary. In the first place manual training has not been adopted by them as the best means of scientifically teaching a trade, but they have been, or at least are now being, established to afford opportunities of acquiring a completer education than is given by the purely lit-

erary course of elementary and secondary education, which, as many critics claim, is entirely too bookish. If the Office understands aright the phrase, "We do not teach a trade" (and the language used by the directors of the St. Louis and Philadelphia schools in particular), so constantly used by the chief officers of these schools, it is as though a college president were to say, "We do not teach Greek to make Hellenists." The object of the work is training, in one kind of school of the mind and hand, in the other of the mind.¹ In both the subject matter of instruction is not the end, but in the manual school this instruction has a practical value, at least to the intending mechanic, while it is quite a common place to say that Greek and other time-honored academic studies are only smattered in to be forgotten. In the second place, these schools are not fostering; they are not yet even boarding schools;² but as educational institutions of a more practical and therefore better type, so it is claimed, place themselves boldly in open competition with other secondary institutions of the country.

To the inquiries, then, as to the social standing of the pupils in attendance at these schools and their subsequent careers may legitimately be added a third, or, for the present purpose, the three may be looked upon as resolving themselves into the inquiries, Are those who are desirous of fitting themselves better for non-technical pursuits or for those called learned (see page 890, extract from catalogue of St. Louis School) following the course of these schools? Are pupils or guardians attracted by the educational advantages these schools offer, an abstract point of view, or by the industrial character of the course, a view essentially concrete and in unison with the practical spirit of a business community?

The indelicacy of asking for information that would show the social standing of the pupils in attendance at these institutions is an insurmountable obstacle to soliciting it. Fortunately, however, for our inquiry the city superintendent of Cleveland gives statistics of the kind desired. The last class entering the manual training school of that city numbered 58, the members being pupils of the Central High School, with the exception of six. Three are orphans. The occupations of the parents are as follows:

Architect.....	1	Clerk.....	1	Railroad purchasing agent.....	1
Civil engineer.....	3	Clerk of court.....	1	Salesman.....	5
Druggist.....	1	Grain inspector.....	1	Saloon-keeper.....	1
Lawyer.....	4	Insurance agent.....	1	Foreman.....	2
Minister.....	2	Manufacturer.....	4	Gardener.....	1
Physician.....	1	Merchants:		Mechanic.....	5
Banker.....	1	Dry goods.....	1	Porter.....	1
Book-keeper.....	3	Lumber.....	5	Roofer.....	2
Business agent.....	1	Grocer.....	2		
Cashier.....	2	Wall-paper.....	1	Total.....	55
		Liquor.....	1		

We have grouped these parents in order to obtain some percentages, but if the reader supposes that much time has been spent as to whether the occupation of a saloon-keeper has more affinity to that of a banker than to that of a druggist or to that of a mechanic he is very much mistaken; the arrangement is rough, and therefore our ratios are only approximate. Fifty-eight per cent. of the parents of the 55 boys were sons of business men—that is, men not following a technical calling; 20 per cent., including the porter and gardener, were mechanics; 13 per cent. were of the learned professions, and 9 per cent. were of a technical calling. Or, using dress as a basis of classification, 80 per cent. of the parents of the 55 boys were in all probability well dressed, and 20 wore common clothes while working. This shows that the manual training school of Cleveland is not by any means occupied with the education of the progeny of the "lower orders." We are, however, no nearer an answer to our inquiry as to the motives that have induced these parents to send or permit their children to attend the manual training school.³

¹The thorough going advocate of these schools as educative institutions might prefer to say that the manual training school, trained the mind *through* directing the hand to perform the mind's dictates, while the college trained the mind to comprehend language, and thereby the ideas of others minds.

²In France the *Écoles supérieures primaires* are.

³In the high school of Philadelphia, then a city of about 200,000, there were in 1840 65 pupils whose parents were classed professionally thus:

Artist.....	1	Baker.....	1	Plasterer.....	1
Clergyman.....	1	Blacksmith.....	1	Plumber.....	1

"Until lately," says John Stuart Mill,¹ "all employments which require even the humble education of reading and writing could be recruited only from a select class, the majority having had no opportunity of acquiring these attainments. All such employments accordingly were immensely overpaid as measured by the ordinary remuneration of labor. Since reading and writing have been brought within the reach of a multitude, the monopoly price of the lower grade of educated employments has greatly fallen, the competition for them having increased in an almost incredible degree."

The founder of the science of political economy remarks:² "The wages of labor in different employments vary according to the probability or improbability of success in them. The probability that any particular person shall ever be qualified for the employment for which he is educated is very different in different occupations. In the greater part of the mechanic trades success is almost certain but very uncertain in the liberal professions. * * * In a perfectly fair lottery those who draw the prizes ought to gain all that is lost by those who draw the blanks. In a profession where twenty fail for one that succeeds that one ought to gain all that should have been gained by the unsuccessful twenty."

The leaders of the manual training movement stoutly maintain the educational value of these schools, but it is a question if the patrons are not reasoning like Adam Smith or Stuart Mill. It is folly to deny that there is considerable discontent with the present system of education which, in its academic features, is an importation, and in the elementary grades, though indigenous, rather the adaptation of modern times³ of a system that had its origin during the seventeenth century among a remarkable people having as its only text-book the work whose momentary presence in the schools causes so much discussion now.

As to the subsequent career of the graduates the Office has some statistics. Let us hear what Director Woodward has to say about the St. Louis school. It is thought the quotation is not too long for those who would know something of this subject:

"The number of students attending the school last year was 230. The number who were graduated, receiving the diploma of the school, in June last was 52. Of those at least eighteen have entered Washington University or elsewhere as freshmen; a majority of these advanced students will become engineers, architects, or teachers. The school thus proves to be a most successful preparatory school for higher education. Those who have gone to work have scattered into a great variety of occupations, the greater number finding opportunity to profit by their knowledge of tool work and workmanship. The tendency towards responsible and lucrative positions is highly marked. The following list of occupations includes all the graduates of the first three classes—1883, 1884, and 1885:

Students of engineering, law, or medicine.....	20
Clerks.....	22
Teachers.....	10
Draftsmen or architects.....	10
Machinists.....	6
Artisans: Pattern-maker, bricklayer, shoemaker with power machine, moulder, electrician.....	5
Farmers or ranchmen.....	4
Business men.....	6
Foremen or superintendents.....	4
Ticket agent.....	1
Engineers—mechanical, civil, or mining.....	7
Manufacturers.....	6
Total.....	101

"Over a year ago the average monthly wages of those in the above list who were earning regular wages was about \$74. Their average age at that time was twenty years.

"In the higher classes of this university I am daily brought in contact with graduates of the Manual Training School, and I have abundant opportunity to observe their mental and moral characteristics. My observation confirms the unanimous verdict of my fellow professors, to the effect that manual training is almost indispensable as a preparation for higher scientific or professional training. It gives great power of close examination and logical analysis. It encourages habits of precision and system in planning and executing tasks. It makes many things possible in the laboratory and class-room which would otherwise be almost out of the question. When a student turns to his draughting in-

³ In an article entitled "L'Éducation Hygiénique et le Surmenage Intellectuel" (Revue des Deux Mondes, 15 of May, 1887, number) Monsieur Rochard, of the French medical academy, remarks: "Each step that civilization has made, each conquest realized in the domain of intellect has been signalized by another addition to the programme of the schools."

struments and to the bench, lathe, or anvil as naturally and with as much confidence as to his table of logarithms or his dictionary, he occupies a vantage ground which his fellows are quick to recognize.

"As to the ability of our graduates to step to the front in the line of practical mechanics, I take the liberty of quoting from the letter of the general foreman of a large system of railway shops, sent in answer to an inquiry as to the outcome of manual training:

"As an employer, I will say for several of the manual training school boys I have working for me, that they will in one year accomplish as much as the ordinary boy (who has not received the training the manual training school gives) will in three. For example, I have two boys working side by side, one from the school and the other an uneducated boy; the former has been working here nine months, while the latter has been here over three years, and to-day the boy from the school will do better, cleaner, neater, quicker work by far than the other boy. One boy learns the trade by imitation, while the other learns it by reason and study. The boy from the school is more precise and neat about his work, grasps a new idea more readily, looks upon the new features of the business with greater intelligence, and is better able to direct others and to bear responsibilities. He has better command of language and can impart to others the ideas he wishes them to obtain. When a difficult point arises the school boy will labor with it until he conquers it, while the other boy will study a while, then give it up. Were I to need a clerk, apprentice, or draughtsman I would and do give the Manual Training School boys the preference, because I get much better results with less trouble."

"I am tempted to add, as a final word, the testimony of a graduate himself (one out of two hundred) and the work he is doing. He says:

"The principal part of my work is the making of wood and brass patterns and core-boxes, and keeping them in order; I also do the greater part of the drawing for the shop; but I am by no means limited to these, as, for the last three or four days of each month, I am called to help get work out, and to help Mr. Jones figure, etc. * * * *I usually get the work that is out of the ordinary line.*"

In the Chicago Manual Training School 19 of the 49 graduates of the first class, that of 1886, are attending higher technological schools, principally the Massachusetts Institute of Technology, Sibley College, Cornell University, and Purdue University. Of the 55 students who have withdrawn from the Baltimore school all but six are following mechanical pursuits. At the Philadelphia school about 20 per cent. have gone to colleges, 10 per cent. have returned to pursue special courses, and about 50 per cent. have engaged in some business in which mechanical skill and drawing is the essential requisite.

With these figures before us we cannot resist the conclusion that the graduates of these schools are apt to follow a mechanical occupation, and the question arises whether this tendency is due to the technological training received in these schools. We have given, on page 870, the analysis of the statistics of the Erie, Pa., high school for the twenty years last past, in which the principal sees a proof of the falsity of the charge that the public schools are educating their pupils to dislike working with their hands; and we will now give the statistics as to the vocations followed by the 600 graduates of the Philadelphia high school from 1843 to 1846, attempting to classify them under two heads:

WITH HANDICRAFT.		OTHERS.	
Architect.....	2	Glass Cutter.....	2
Dentist.....	1	Hatter.....	2
Druggist.....	9	Iron Founder.....	2
Engraver.....	12	Machinist.....	26
Baker.....	2	Mariners.....	15
Blacksmith.....	13	Painters.....	8
Book-binder.....	10	Plasterers.....	2
Bricklayer.....	17	Ploughmaker.....	1
Brickmaker and stone cutter.....	8	Plumber.....	1
Carpenter, etc.....	83	Printer.....	20
Cooper.....	2	Sadler.....	8
Cordwainer.....	25	Sailmaker.....	2
Currier.....	11	Tailor.....	3
Cutler.....	1	Tinman.....	3
Farmer.....	20	Tobacconist.....	3
Gilder.....	2	Watemaker.....	4
		Weaver.....	4
		Cadet.....	2
		Clerk.....	45
		Stores.....	169
		Conveyancer.....	17
		Engineer.....	10
		Grocer.....	4
		Jeweler.....	3
		Lawyer.....	4
		Manufacturer.....	3
		Physician.....	2
		Teacher.....	33
		Unascertained.....	22
		Dead.....	1
		Total.....	639

It will be observed that the clerks, that much-abused class, compose about 35 per cent. of the whole number as far as ascertained. It will also be noted that about half of the whole number labor with their hands. To such the technological training of the manual training school would have been of more or less value.

The total number of graduates from the several schools has been 589, of whom 275 graduated in June, 1888.

Turning to Table 78 we find that the number of pupils enrolled, is of males, 3,246; of females, 293. Comparing the statistics of the schools reporting for the year 1886-87 and

for the year under review, excluding the statistics of the New York college department, there has been a net increase of 493 in enrolment. Of this increase the Baltimore school has contributed 328 pupils, due to causes already explained.¹

The statistics contained in Columns 8 and 9 would seem to show that the attendance was maintained quite evenly during the year, although large increases are noticed at the Cleveland and Philadelphia schools. The very valuable statistics of the public school systems, known as average attendance, not being attainable here, these questions (the captions of Columns 8 and 9) were asked in hope that the answers would show, approximately at least, the variation of attendance during the year. Thus it will be observed that the enrolment of the Chicago school (Column 6) is given as 202, the same as the answer to Column 8; that the same columns and Column 9 show 130 enrolled at the Hebrew Technical Institute and 90 present December 1, 1887, and 110 June 1, 1888. The New York City College department had 198 enrolled and 176 present December 1, and 158 June 1. Philadelphia returns 289 enrolled during the year and 328 present June 1, 1888. Suppose the Office were inclined to satisfy the craving after "per capita" expense, not for purpose of convenience in comparing an institution at a specific date with its record, but for purposes of comparison with other schools, ought it to take, in the case of the Hebrew Technical Institute, for instance, "The total number enrolled excluding duplicates," that is, 130, or 90, as given in Column 8, or 110, as in Column 9, giving respectively \$100, \$144, and \$117 as the per capita cost? It is the same with the fine schools of Chicago and Philadelphia, although the variation is by no means so large.

TABLE 79.—Manual Training Schools, Finances and Property Values.

c The amount of subscriptions.

d The interest from the Girard fund for 1887 was \$1,228,189, of which \$446,992 were expended on the college.

e Books, \$900.

Remarks on Table 79.

Of the several columns in which are given the receipts of manual training schools the two devoted to the amount received from municipalities and from tuition fees are the most interesting. Considering the public schools only, Philadelphia stands first with an appropriation of over \$19,000, 73 per cent. of which was expended in salaries; at the Baltimore school, 69 per cent. of the \$16,000 appropriated were expended for salaries, excluding that of the principal for reasons already noted under Table 75.

The expenses of the Baltimore City College—the city high school—for the year 1887 were \$35,293, of which 78 per cent. were for salaries. For the same period the amount paid for salaries in the Manual Training School was about 60 per cent. of the total amount (\$11,000) expended, and the cost of material for lessons in the shops, 5 per cent. This matter of proportionate expense will be again taken up.

The very large appropriation made for the Cleveland school must also be noted. Of the schools charging tuition, the St. Louis and Chicago schools are preëminent by reason of their receipts from this source, the latter being the only manual training school, precisely speaking, that reports an endowment. Of the \$1,945 (Column 8) received by the Chicago school, \$1,763 were given by the Chicago Commercial Club to supply a deficit, and, as before stated, the Cincinnati Commercial Club pays half of the expenses of the school in that city. The Hebrew Technical Institute is entirely supported by subscriptions. No gifts or bequests have been made to this class of schools.

Of the expenditure for new buildings, the amount expended at Philadelphia and at the Miller Manual Labor School, where forging and foundry work have just been introduced, are noteworthy.

Comparing the amount paid for salaries in the Chicago, Baltimore, St. Louis, and Philadelphia schools, and bearing in mind that the principal's salary of the Baltimore school (\$2,400) is not included in the amount paid by that school, it is noticeable how little they vary. These schools are complete institutions, not departments of a high school or college, and now are fully equipped for work. If these figures can be generalized upon it may be said that the annual cost of the teaching corps of a manual training school falls somewhere about fourteen or fifteen thousand dollars. It must be admitted, however, that the Hebrew Technical Institute pays a third less than this, but as the course has recently been extended, additional instructors may be required. The Cincinnati Technical School, also complete in itself, may be said to have just gotten fully under way. Considering the same schools as above, the annual cost of materials used is between seven and nine hundred dollars annually.

The reader will readily see that if the cost of teaching in an institution containing 10 students were \$10,000, the per capita cost of teaching would be \$1,000; and if in the same institution, with the same teachers, there were 100 students, \$100. In brief, not to expand so obvious a thought, before such a per capita becomes of value it is necessary, especially when the amounts are comparatively small, to have, as a standard, the per capita of some school, ideal or real, where the teaching is perfection and the attendance just what it should be, and even then it would be necessary to compare the facts of observation, as well as the averages. But the cost of the material annually used, although not entirely free from error, has an individuality about it that does not belong to the teaching of a member of a class. Comparing the number of pupils (not the average attendance be it understood) enrolled in the manual training department (Column 12, Table 78) with the cost of material used, the following per capitâs are obtained, so varying as to defy generalization:

Chicago High School Department.....	\$4.96
Chicago School.....	4.12
Baltimore School.....	2.50
St. Louis School.....	3.92
Omaha High School Department.....	1.56
Hebrew Technical Institute.....	5.77
New York City College Department.....	.62
Cincinnati Technical School.....	4.84
Philadelphia School.....	2.13
Miller Manual Labor School.....	6.22

INDUSTRIAL TRAINING.

In the foregoing division we have examined a species of educational influences which is brought to bear upon the pupil by placing in his hands the implements of mechanical labor. We have seen that this education of a pupil by his using tools has been a development, a compromise between the theories of an educational philosopher and the practical system of teaching the principles of the mechanic arts inaugurated by a Russian engineer. We have examined the opinions of those who contend for the introduction of this education as such into the public schools and the view of an opponent, while attempting to find what one side desires and the other opposes. But we have

neglected the argument of the party which would have the study introduced as a matter of political economy, whose argument may be briefly stated by the pedagogical commonplace, "What you would have come out in the land you must first put in the schools." Teach the mechanic arts in the school and you will have mechanics without number, just as the public schools are turning out, say the members of this party, a multitude of half-grown persons incapable of filling any position save that of a clerk, just as the State board of Massachusetts would put drawing into the schools in order that "in a few years our enterprising people will begin to discover in our own communities and schools as good artists and artisans as can be found in the most favored portions of other countries." This is not a pedagogical argument, but the practical common sense of a man of business, and as long as the sentiments expressed by the New York Industrial Association continue to have a following so long must manual training and industrial training, elementary or technological, be kept separate and distinct.

One of the most important purposes desired by the partisans of industrial training, and by those of manual training also, is the inculcation of ideas about labor that will remove the contempt in which it is now said to be held. If the public school pupil can be familiarized with tool work before this unreasonable prejudice can be formed the idea that manual labor is degrading will not be an obstacle to pursuing some form of it; the pleasant nature of the manual training not producing the repugnance towards labor that is felt towards books and study by those who have pursued the usual literary course of the public school. But here the two great parties to the propaganda part company. The industrialists, however, are not unanimous as to the philosophy of their object. Some observing the beneficial results of manual labor in reformatory or protective institutions, on those ambiguously called "juvenile delinquents," appear to view the whole schoolable body, or a large part of it, as wearing the menacing attitude of the "juvenile delinquent," and the public school as a sort of reformatory or protective institution. Others, seeing how unequally the wealth of the world is distributed, think it but right that the monied class, for several reasons, should make some compensation to the less fortunate. Finally, a third section, and this appears to be not only by far the largest, but also of native American growth, would have the schools used as apprentice shops. We may only briefly refer to the second and third opinions, the social importance of the first would require a chapter to itself.

A SOCIALISTIC VIEW OF THE QUESTION.

In giving the characteristics of the course of manual training instruction at Paris, we have refrained from giving a feature that is very remarkable to Americans, at least as a feature of the public school system. Not only are manual training shops added to the equipment of the schools, but a kitchen and dining room have been annexed, in which meals are served for the children. Those who can, pay the small fee asked; those too poor, are given, in a way that the recipients need not be known, the ticket that permits them to obtain the meal. If the parent is too poor to properly clothe the child, the director gives the child an order on the clothing contractor. "It is interesting to see at what little expense this advantageous institution can be introduced into a school, and I" (we are quoting from Consul Schoenhof's report on industrial education in France) "give here in illustration the account of one of the schools. This school has about 500 pupils. From October 1 to December 1 they distributed 5,260 portions, of which 4,116 were sold. The whole cost to the school was 367 francs 85 centimes [about \$74]; the receipts were 205 francs 80 centimes, leaving a deficit of 162 francs 5 centimes [about \$32]."

Commenting on these facts, a writer in a religious journal of the highest literary character uses the following language, republished by the great Industrial Association of New York:

"While the world has had its attention wholly occupied with military preparations and intestine dissensions on the part of France, that country, especially the Socialistic government of its capital, has been silently elaborating an experiment in education that now ought to challenge the attention of every thoughtful mind.

"For this experiment should be credited to Socialism in its noblest aspect. Paris is at present Socialistic—that is to say, inclined to Socialism, though not yet Socialist; and so is its present municipal council. At a recent election that capital gave to the Socialist candidate for a vacant seat in the lower legislative chamber over 100,000 votes, while the united opposition could muster but 135,000 votes, and even the candidate who united these votes upon himself had to style himself a "Socialistic-Radical." The municipal council, though not having more than a dozen thorough, self-conscious Socialists, is yet in its ruling majority governed by Socialistic instincts. In no way is that better shown than by the thoroughness with which they have carried out two educational acts passed by the French legislature in 1880 and 1881.

"These acts provided for perfectly gratuitous, compulsory education of all French children, and—what is the significant feature—manual training in the public schools. This, it must be understood, is a very different thing from the technical institutions that already existed in France, as well as other countries, even in Russia, for the special training of the few for becoming skilled managers, foremen, or artisans. The recent French legislation proposed to make industrial and art education an organic, an integral, part of the whole system of public instruction, and to have manual training begin at the very bottom of the school system; to have it run from the "kindergartens" through the primary, grammar, and high school grades, so that every child, whether destined to be a mechanic or not, should have its hands and mind trained in industrial operations."

Thus it is apparent there is a party of those who urge industrial education which they call manual training on socialistic grounds. Whether these warm-hearted and devoutly religious individuals are they whom Browning, in his *History of Educational Theories*, describes as "those who have wished to reform or to reorganize the world, meeting with many difficulties in dealing with the mass of grown-up people, have turned their eyes to the more hopeful body of ingenuous youth, whose minds are like white paper or pliant wax," and who, as he says, should have been taught better by experience than to indulge in such hopes, or whether they are perfectly justified in entertaining such hopes on the elder Humboldt's aphorism which we have quoted above, must be left to the statesman, and to the reader to decide for themselves.

THE PRACTICAL PARTY'S VIEW.

But by far the larger party is that which sees not the regeneration of the world, not the philanthropy of the thing, but its practicableness, its directness in going into business at the earliest possible moment. It recognizes with the poet that "art is long and time is fleeting," and with Lord Salisbury that the first necessity of man is to live, and his first duty to work. As to culture it would say with Mr. Frederic Harrison, "perhaps the very silliest cant of the day is the cant about culture." The apprenticeship system, says this party, is a thing of the past, and its downfall is one of the most portentous signs of the times. In looking around to find a substitute it sees in the public schools an organization durable and respectable, upon which trade instruction can be grafted. These schools teach too much theory, says this party, and by curtailing such instruction, ample time may be obtained for industrial teaching. The president of Harvard also thinks that the public school course could be advantageously shortened, but he would have this done that the pupil may be enfranchised the sooner, and thus enabled to begin other work.¹ The "conflict between labor and capital" is also a great element in this party's argument, but as this is to be remedied by a substitute apprenticeship system, it resolves itself into that question.

MANUAL LABOR AS MANUAL TRAINING AND AS INDUSTRIAL TRAINING.

The superintendent of an institution for educating one of the "special classes" may think that the mere fact of calling tool-work in a public school manual training and tool-work in his school industrial training, does not make a real distinction. He may think that the work of his school loses none of its value as a form of education because it is used in learning a specific branch of industry.

But it is to be observed that, in the first place, the work of one of these institutions is made for sale, making it more of a factory than a school; in the second, specific trades are taught which the advocates of real manual training are almost tired of telling the public they do not teach; and in the third place the paternal feature is present, the care for the pupil's future business life, that characterizes benevolent foundations.

Should it still be objected that these are differences of a material nature and have no bearing on the effect produced by the work, the Office will, in order to avoid the psychological as it has the social discussion of this question, defend its classification on the perfectly obvious grounds of difference of aim. Technological schools, are treated elsewhere.

I.—INDUSTRIAL DEPARTMENTS OF SCHOOLS FOR THE SPECIAL CLASSES.

Not long after Haüy conceived the idea that since a blind man can readily distinguish two pieces of money he could also distinguish an "a" from an "f" if he could feel them, the first school for the blind was established in Paris, about 1784. Music from the first was a prominent feature of its instruction. The French Revolution having scattered the *Société Philanthropique*, by which the tuition of the blind pupils was paid, the state adopted the school. By the great reorganizers of those tumultuous times the school was at first united with that for the deaf, the first instance of this undesirable combination; then given the character of a workshop and its scholars called "young workers,"

¹ Can School Programmes be Shortened and Enriched, p. 1005 U. S. Education Report 1886-87.

in conformity with the practical spirit of the day; then attached to an asylum; and finally, under the restored Bourbons, reorganized as a separate institution. The new regulation, issued in 1815, says that the aim of the school shall be "to instruct blind children and to give them a *useful trade*."

It may be safely assumed that the many schools established in Europe on this type during the first ten years of the century were also dual in purpose, aiming to impart knowledge and a trade. "The blind in the United States are socially far above those of any other country," says F. J. Campbell, the president of the Royal Normal College for the Blind, of England, and as even now in America it is thought advisable by some to impart the rudiments of a trade in view of the great majority who follow the humbler callings of business life after leaving the school, so, in all probability, was it deemed advisable in Europe in the early decades of the century.

The blind child, having lost the most important of the senses that connect the human being with the outer world, is compelled to rely upon a more than ordinarily heightened condition of the others—Dr. Armitage¹ would say upon a superiority "in intelligence"—in the conduct of life, and his profession should be adapted to his physical condition. Such a profession is music. This subject in its branch of tuning was first introduced into the Paris school by the persistency of a pupil, whose success soon put this instruction on the highest plane of proficiency, and it has become one of the most important objects of the school, though instrumental music as such is most thoroughly taught.

About 1859 systematic musical instruction was introduced into the Perkins Institution at Boston, and, under the immediate superintendency of F. J. Campbell, carried to a high degree of proficiency. In England it was not until 1872 that the Royal Normal College and Academy of Music for the Blind was established.

But while music is eminently adapted as a profession for the blind, by its side in our institutions is the workshop for making brooms, brushes, mattresses, and caning chairs, not introduced, it is believed, on Froebelian principles. "When the three schools of New York, Boston, and Philadelphia were established," says Superintendent Wait, of the New York Institution,² "undoubtedly the views held in Europe, concerning both young and old, made a great impression upon those who established them. The European view was that blind people are, in some way or other, destined to work with their hands."

Turning now to the schools for the deaf the double technical feature is not present, only the workshop remains. Superintendent Clarke, of the Arkansas Institution for the Deaf,³ put the case of industrial education in these institutions thus: "The high honor of establishing the first schools in this country where any persistent attempt was made to teach trades belongs to the institutions for the deaf," and he rather regretfully adds, "But though we began first I hardly think we are keeping abreast of those who started later in the race."

In the schools for the feeble-minded but little, even a little in this case is extraordinary, can be expected; from the reform schools much more than has yet been attempted. In the latter case, however, a reaction has set in against "the self-supporting" theory, as shown in the last report of this Office.

The tables which follow are the first of their kind. They show the statistics of the industrial and, in the case of the schools for the blind, the musical departments of the several classes.

IN SCHOOLS FOR THE DEAF.

"Suppose we simply told a pupil in school to add," says Superintendent Clarke in the address above quoted from, "and never taught him to carry. He might, after a long effort, find it out for himself, but his progress in arithmetic would probably be very slow; yet that is the way trades are taught [in a work-shop of an institution for the deaf taught in an abstract way]. The help the master gives is often worse than none. He 'lays off' the work and leaves the pupil to do it. Better let the pupil 'lay off' and teach him how to work. * * * If he makes mistakes they may be pointed out, but the reason why he made them is very seldom explained to him. * * * If there is any possibility of a boy picking up the knowledge necessary to use it on the job in hand he is left to do so; if not, so much of its use as there is present pressing need for is explained, and no more."

"Are the masters of the shops responsible for this state of things? I don't think so. * * * Their efficiency is judged, not by the shortness of the time in which they can teach a boy their trade, or the number they teach, but by the amount of finished work they turn out—by the dollars and cents the shops make or save."

"This is the fundamental error that lies at the root of all our mechanical teaching and causes much of our trouble. We expect profitable work from learners."

¹ The Education and Employment of the Blind, p. 62.

² Proceedings ninth Biennial Meeting Instructors of the Blind, 1886, p. 36.

³ Proceedings Eleventh Convention of the Instructors of the Deaf, 1886, p. 213.

As Superintendent Clarke, in order to bring out the lights of the "Russian system," may unintentionally have painted the insufficiency of the present industrial instruction in colors too sombre, we will quote from the remarks of Principal Williams, of the American Asylum for the Deaf, in his report for 1885-86: "Almost from the foundation of this school [the first for the deaf in America] industrial training has formed an important part of the education of every able-bodied pupil. So long ago as 1824, two shops had been built for the use of our pupils. If I am not mistaken this school was the pioneer in this country of conjoint industrial and literary education, and most of the schools for the deaf in the United States have followed its example.

"The success of the experiment undertaken by the managers of the school, with many misgivings at first, very soon demonstrated its wisdom. The habits of industry here acquired clung to the pupils as they went forth to the duties of life, and with rare exceptions they have been industrious, self-supporting, law-abiding citizens, not ashamed of work, and having the knowledge and skill to do their work well.

"This double education is insisted upon in the case of every pupil. Sometimes, in mistaken kindness, parents plead to have their children excused from the industrial training, as they will not need to work for a living, or, at least, will not pursue the trades taught here. We can make no exceptions on such grounds. Habits of industry are invaluable, and they should be acquired at the formative period of life. It is of much less importance what one learns to do, than that one should learn to do promptly and well whatever one undertakes. With industrious habits, a trained eye, a skilled hand, and a cultivated judgment, one may acquire a new trade with comparative ease, but where all these are wanting, to start on any new line of work is a difficult task."

The principal then describes the manner in which the two principal trades—cabinet and shoe making—are taught, quotes from a recent address on manual training by the Hon. R. B. Hayes, and remarks on the occupations followed by the male graduates thus:

"It will be seen at a glance at the list given above that there is great variety in the occupations of our former pupils. Comparatively few of them have followed the trades learned here, but all have carried with them the trained hand and eye, the cultivated judgment, and industrious habits here acquired."

At the Pennsylvania school, the third to be established, of 119 pupils taught shoe-making or tailoring (the trades principally taught), 34.5 per cent. followed that taught them at the institutions, and supported themselves thereby. Shoemaking is a very popular trade.

a Six pupils attend the manual training department of the Chicago High School.

b Wood-carving, designing, and clay modelling.

c Pupils are taught the use of wood and metal working tools.

Of the 41 institutions giving industrial instruction three confine their endeavors to agricultural occupations. Of the other 38, 29 teach carpentry and joinery, or both, 29 shoemaking, and 23 printing. These trades are not special to any particular institution, but are all, or two of them at least, present in the great majority of instances. Of the trades whose following is given in Column 8, tailoring, sewing and dressmaking have the most prominence by reason of the number pursuing them.

The number represented in the table as being taught an industry is 2,743. Of these 16 per cent. were receiving instruction in printing, 19 per cent. in carpentry or joinery, and 22 per cent. in shoemaking. The Office can now state, what it found itself unable to give in the last report, that shoemaking is the most largely followed of the several trades for the deaf, that it is closely followed by the trades of carpentry and joinery considered as one, and this, with an equally small interval, by printing; the three trades, calling carpentry and joinery one, having 57 per cent. of the whole number receiving industrial instruction.

These 2,743 pupils are taught by 175 teachers, of whom 37 per cent. are females. This would make 15.5 pupils to a teacher, but an inspection of the table will show that this can not be taken as a "typical" number, that is, it is nothing more than an average.

Five hours is the time devoted to school work; this is quite plainly shown, but the average time devoted to industries is not so apparent. The full employment of shop foremen, and it is very desirable that he should be wholly employed by the institution, has tended not a little, according to Dr. Fay, to an undue extension of the daily time of the pupil. The question on our blank form, the answers to which are tabulated in Columns 9 and 10, reads as follows: Number of hours devoted to school, —; to industries, —. Perhaps the question was not adapted to the purpose intended; that is, to bring out how many hours daily the pupil spent in school and how many in the workshop.

From two to three hours, in about 80 per cent. of the institutions reporting industries, is the time devoted to such work. In several instances it is four or over. Whether this is to be explained on the ground given by Dr. Fay, or has arisen from a misunderstanding of the inquiry, or from the peculiar manner of dividing the pupils' time, or whether it needs no explanation, we cannot say.

It is to be noted that several of the pupils of the Chicago day schools and of those of the Horace Mann School, Boston, receive instruction at the manual training school of those cities respectively, and that the pupils of the Chicago Voice and Hearing School are taught wood carving, designing, and modelling, etc., and those of the Private School of Philadelphia the use of wood and metal working tools. The day schools with these exceptions make no return of industrial work, or, perhaps it should be called, in the cases reporting, manual training.

IN SCHOOLS FOR THE BLIND.

Music being taught primarily as a means of livelihood in after life, the blind school has two species of technical training running concurrently with the school department.

The piano and the organ are the instruments most used, and as both are costly the thorough equipment of a school with these means of instruction is very great, to say nothing of the repairing and replacing of them when old. The noise of the constant practice is also an unpleasant feature, and extraordinary methods of construction, likewise expensive, are necessary to obviate this.¹ For the study of musical acoustics the piano-tuner must have an expensive apparatus at his command, and to become an artist he must, if not a genius, have an artist as an instructor, the most costly feature of all. It will be at once apparent that the establishment and maintenance of a first-class school for the musical instruction of the blind is a very costly undertaking.

But the cost of establishment and maintenance is dwarfed by the amount of patience and labor required from the pupil to master his profession. We translate from Monsieur Guadet's article on the blind in the *Dictionnaire de Pédagogie*: "The scale is not for the blind what it is for the seeing. There is more head-work and less 'practice,' but the exercises are more analyzed, the composition and dismemberment of phrases more thorough. The professor executes on his instrument the most complicated phrases, and the pupils must tell all the details. This is called phrasing. In these same classes the students are exercised each day in chorus singing. As instrumental music the pupil studies on the piano by means of music written in the Braille system. He reads with the left hand for a phrase the part that the right hand performs, then he reads with the right hand the part that the left performs; then the two parts, retained by the memory, are performed in concert."

"The orchestra of the Paris institution produces with the same number a better effect than an orchestra of seeing performers, and this is the reason: The blind, in addition to the innate predisposition to music existing in many, having no occasion to turn pages, but playing from memory, can give their attention to execution. After each part has

¹ See Commissioners' Report, 1886-87, p. 839.

² Long the principal of the Paris school.

been learned in private it has been connected with the parts of the other performers so inseparably that it is only this connection that remains in the performer's head and he executes it with feeling and with his whole soul."

As to the methods of the industrial department there seems to be no objection raised against them, the whole attention of the friends of the blind being given to solving the problem of providing workshops for the adult blind. As this was noticed at some length in the report preceding this,¹ the reader is referred to it.

Total.....		45	49	1,204	1,531	217	36	37	352	396	322	

a "Number taught as such."

With the exception of the Florida institution, instruction in music is given by all the institutions in the table, and with the exception of the Florida, California, and the Nebraska institutions, all have industrial instruction. In the music department there are 94 teachers, in the industrial 73; in both females are slightly in excess.

The statistics contained in Columns 4, 5, and 6 are not, it is thought, mutually exclusive; there is nothing in the study of vocal music that excludes the study of an instrument or in either that excludes the study of piano tuning. In the case of Columns 9, 10, and 11, however, it is believed that those engaged at broom-making are not included in the number given as engaged in seating chairs, etc. The question, however, arises how many of those studying instrumental music are included in the number of those following trades. Taking the total number studying instrumental music as represent-

¹ Page 833, under Workshops for Blind, and page 839, under Conventions.

ing the maximum attendance in the department of music and adding to this the number pursuing trades, the result rises several hundred above the total attendance of the institutions represented. The question is still further complicated by those too young to work being included in the attendance, and by the presence of female pupils.

Under these circumstances it is of very little use to make comparisons between the two departments of work; and as it is perfectly conceivable for the same pupil to sing, play, and tune, it would also be unprofitable to examine into the relations of the statistics of Columns 4, 5, and 6. To obtain unimpeachable data for such an undertaking would require more minute inquiry and, therefore, more trouble to the superintendents than the results would warrant. But it is perfectly proper to compare the statistics of the tuning branch of the musical department with the statistics of the other trades taught. The total of the four columns involved is 1,287; of these 30 per cent. are at cane seating; 27 per cent. at broom-making; 17 per cent. at tuning, and 25 per cent. at other trades.

If it be assumed that the number playing instruments is approximately the number in the music department, there would be indicated 16 pupils to every teacher. In the industrial department the total number of students, if divided by the number of teachers, gives 14+.

In considering the columns giving the time devoted to the two departments it is necessary to read the numbers in the columns as though they answered the question, How many hours does the music pupil devote to music; how many does the industrial pupil give to industries? When the figures are large it is assumed that practice time is included. Three or four hours seems to be the time generally devoted to industries, and six to eight in music, but it was impossible for the superintendents to give the many and varying periods of time allotted to each of three departments, especially when instruction in one of them is so individual as is the teaching of instrumental music.

IN SCHOOLS FOR THE FEEBLE-MINDED.

Most public schools of this kind have two departments—school and asylum. It has been found profitable to add to the usual school work some form of manual labor, and this has resulted, at the Kentucky institution at least, in the pupils acquiring considerable proficiency.¹ Farming is the occupation most adapted to the feeble-minded, but carpentry, broom, mattress, and shoe making, and for the girls, sewing, are very generally introduced. As in the case of the blind, though for an obviously different reason, the attention of those having the care and, as far as possible, the education of the feeble-minded is directed towards providing homes for them, in which they are to work and make themselves as useful as possible. The loss of sight makes the blind man a poor business man, while the weak intelligence of feeble-minded persons causes them to become the victims of the unscrupulous or of their own passions.

¹ The experiment at the Kentucky institution is given in the report preceding, p. 759.

TABLE 82.—*Statistics of Schools for the Feeble-Minded.*

	Name of School (full name and location given in Table 94).	Industrial Instructors.		Pupils.	Duration of Work in Hours.		Occupations.

12	Massachusetts School.....	2	2	74	6	6½	Broom and mat making, farming.
13	Wilbur School.....	2	3	39	5	2	Farming and sewing.
14	Minnesota School.....	2	1	0	6	3	Farming, brush-making, etc.
15	Nebraska Institution.....	0	0	0	6	0	
16	New Jersey Home	1	0	8	5	3	Farming and housework.
17	New York Custodial Asylum...	0	1	80	2	4-5	Housework and sewing.
18	New York Asylum	3	5	60	5	5	Brush and shoe making, carpentry, etc.
19	Sequin Physiological School ...						Fancy work for girls.
20	Ohio Institution.....	8	5	102	5½	8	Tailoring, shoe making, carpentry, etc.
21	Pennsylvania School	3	6	322	6	9	Shoe and mattress making, carpentry.
	Total.....	41	40	1,013			

The teaching force in the above class of schools is equally divided between the sexes, and gives, if averaged, about 13 pupils to a teacher, the number of pupils being 1,013. As the pupils are graded by intelligence so is the work distributed; the more intelligent doing carpentry, the next lower shoemaking, and the third class broom and mattress making. The whole number reported as in these institutions is 4,321, of whom about 25 per cent. are receiving some kind of industrial training. Five or six hours of the day are given to school work and 4 to 6 to work.

IN REFORM SCHOOLS.

As the State in exerting its unquestioned right to seize and hold the juvenile offender or vagabond intends to return him to society, what excuse, especially in the latter case, can be offered for compelling him to live with criminals and for returning him finally able to read and write perhaps, but without an occupation? The great cry for manual training, by a great many understood in the sense conveyed by "industrial training," is everywhere heard to prevent boys being sent forth into the world with the elements of learning, but without the elements of a handicraft. The aid of the state is invoked to furnish the means of giving industrial training to those who have parents and friends, but here, where paternal authority has been legitimately assumed to the extent of depriving the petty juvenile thief or, as in most cases, the vagabond of his liberty, very little industrial training obtains. Not that work has not been furnished; the contract system has provided for that.

The distinguishing characteristic of the contract system is the amount the State can get from the contractor and the contractor out of the boys. "The interest of the contractor," says a committee in New York appointed to investigate this method several years ago, "and the terms of his contract may require that certain prisoners shall be employed at a particular kind of work as long as practical, while the interest of the pris-

oner and the proper conditions of his reformation and transformation into an industrious and worthy citizen may require that he should be put at a different kind of labor." It is true that contract labor is rapidly becoming a thing of yesterday, but now as it passes out of existence, in each particular instance, the superintendents are compelled to see even this wretched substitute for industrial training taken from their school without means to provide the proper kind, and are inclined to think, with the superintendent of the Illinois school, that "the money required to carry on such industries with but little prospect of profitable return on a currency basis is the only apparent obstacle to technological labor in a reform school."

As a trade, properly so-called, for boys detained in a reform school, shoemaking is the most extensively followed, carpentry coming far behind in point of numbers, the percentages being 12 and 3 respectively of the total number reported. If the decided manifestations of a desire to introduce manual training into these schools, for industrial pur-

poses, continues this great disparity will soon disappear. There is this, however, to be said in favor of shoemaking as opposed to manual training, it is a trade. When the student is dismissed he has learned, his term of confinement and the character of the instruction permitting, to do one thing and not the underlying principles of all mechanical things. In a word, he has a means of livelihood.

In the column headed "agriculture" we find about 2,000 pupils, 27 per cent. of the whole number. Whether these boys can be said to be learning a trade, i. e., making themselves proficient in a useful occupation, or are merely to be considered as employed about the farm, (these schools have very generally that feature to occupy their time) is more than this Office can say. It would seem that the agricultural instruction given is very far from being that which obtains at real agricultural schools.

Nearly 59 per cent. of the pupils, boys and girls, are not in the three occupations which the Office, rightly or wrongly, supposed to be the most generally followed when making up its form of inquiry. There are 12 remarkable instances of this divergency, and we proceed to investigate them.

In the case of the Connecticut Reform School the great majority of the boys are employed at cane-seating, 225 for the present year, and it seems to be very much the same at the Maine School at Cape Elizabeth. At the St. Mary's School 144 of the pupils are employed in cigar-making and 104 in tailoring and 14 in the printing office. At the Michigan School printing is taught and the boys are employed in mending the clothes worn by the inmates and in making the repairs incidental to the heating and lighting of the building. At the Newark City Home brush-making is extensively followed. At the New York Juvenile Asylum tailoring is taught; at the New York House of Refuge hosiery and painting, and at the Catholic Protectory tailoring, printing, and cane-seating. At the Ohio Industrial School brush-making, hosiery, printing, and tailoring are taught. At the Pennsylvania Reform School brush-making is taught to a large number. At the Sockanosset School brush-making, printing, and tailoring are taught, and at the Vermont School cane-seating is the only occupation. In the greater number, if not all, of these schools the pupils do the baking, laundry work, etc.; these, however, can hardly be called trades.

We have hinted above of the encouraging growth of real technological instruction in these schools (polytechnic shops as the Ohio School superintendent calls his) stimulated by the agitation of the subject of "manual training" in the community and the abrogation, gradual but sure, of the contract system. We can not discuss this growth here, but will return to the subject in future reports.

In considering the columns in which are given the instructors, classified by sex, it appears that the female element in many instances is quite prominent in schools for boys only.

In our opinion Column 8 is the most important of the table; but as it has been introduced here merely as a complement to Column 9 we will confine ourselves first to discussing the two as one whole and then the latter by itself.

About 78 per cent. of the schools reporting devote from eight to ten hours daily to school and to shop or other work. Of these about a third require eight but less than nine hours of mental or manual employment. In a number of cases the time is equally divided; where a disparity occurs most frequently the longer time is in the column showing the duration of work in industries. We note that at the Burnham Industrial Farm, the establishment of which we had the pleasure of noting in our last report, that five and a half hours are devoted to school and four to industrial work, and at the Massachusetts Primary School the periods for school and shop are respectively five and three and a half.

The time given at the several institutions to industrial employments in 78 per cent. of the schools is from four to six hours. Of these the cases in which the time is four but less than five hours are about one-third of the whole number. In the manual training school, where half of the day is spent in the shop, the time is about two hours at physical labor; in the public schools of lower grade the time is much less.

"INDUSTRIAL SCHOOLS."

The somewhat anomalous class of schools contained in the following table are mostly for the poor and friendless. There are many more of them from which statistics have not been received; indeed the list could be swelled indefinitely. The life of these schools is rather ephemeral in many instances, and their character more distinctly indicated by the word "protective" than by "educational" or "industrial." Owing their foundation and maintenance to private charity, they differ considerably in methods of management and government. The character of the schools as charitable institutions indicates a strong religious sentiment in the persons by whom they are supported, and it is only natural to suppose that in them the spiritual as well as the intellectual and physical needs of the pupil is cared for.

To classify the immense number of schools of this and several similar kinds will be one of the duties of the Office during the ensuing year.

* For the year 1880-87.

II.—TRADE SCHOOLS.

Three important schools have been established during the year—the Williamson School, to be located either in or near Philadelphia, the Rindge School of Cambridge, Mass., and the Pratt Institute of Brooklyn.

THE WILLIAMSON SCHOOL.

The plans and purposes of Mr. G. V. Williamson, who lately announced his purpose to establish and endow a great trade school, are fully set forth in the statement which he has caused to be published in Philadelphia. The Pennsylvania Company for Insurance on Lives and Granting Annuities is made the fiscal trustee to hold the fund with which the school is endowed. This fund consists of securities amounting, at their par value, to \$1,596,000, but of an estimated worth of \$2,225,000. This fund, under the deed of trust, is to be appraised and then divided as nearly as may be into two parts. One-fifth is to be composed of securities which are easily and advantageously salable, and will constitute the building fund. The remaining four-fifths will go to the endowment fund. With the consent of the seven trustees the fiscal trustee is empowered to sell any securities and reinvest the proceeds as may seem desirable. Provision is made for the merging of any funds that may hereafter be devised or given to the school.

A body of land not exceeding 300 acres is to be purchased, lying either in Philadelphia or in Bucks, Delaware, or Montgomery Counties, but there is a further provision that not more than \$400 per acre shall be paid. After giving directions for the selection of a healthy neighborhood and the erection of fire-proof buildings, the deed says:

"I leave to the judgment and discretion of the trustees the character, number, and extent of the said buildings to be erected, but, as the great object to be attained is to board, lodge, clothe, educate, and instruct in mechanical trades those who, when arrived at manhood, will be obliged to labor with their hands for their support, I particularly direct that all palatial structures, expensive materials, and elaborate ornamentation or decoration shall be avoided, so that the scholars may not, by reason of luxurious or expensive accommodations and surroundings, acquire tastes or habits which may unfit them for their trades in the sphere of life in which their lots are to be cast."

After referring to the appointment of teachers, officers, and agents, all of whom are to be selected by the trustees, specifications are given as to the admission requirements.

"When the school is prepared to receive scholars, the trustees shall from time to time receive and admit to the school as scholars as many able-bodied and healthy young male persons of good moral character, of such ages between 12 and 18 years, as may from time to time be determined by the trustees, as in the opinion of the trustees the extent, capacity, and income of the school will provide for. Preference shall be given in the admission of scholars: First, to those born in the city of Philadelphia; second, to those born in the county of Bucks, State of Pennsylvania; third, to those born in Montgomery or Delaware Counties, Pennsylvania; fourth, to those born elsewhere in Pennsylvania; fifth, to those born in the State of New Jersey; sixth, to those born elsewhere in the United States. And in all cases, other things being equal in the order of preference, the preference shall always be given to the poor. But I especially direct that no scholar who has been properly admitted with reference to the order of preference shall thereafter be displaced to make way for any later or subsequent applicant who may be higher in the order of preference hereinabove directed to be observed. And the decision of the trustees as to the number of scholars to be admitted, and as to the conflicting claims of any or all rival candidates for admission, shall be final and conclusive upon all parties. All scholars admitted to the school shall be bound as indentured apprentices to the trustees, by their parents or guardians or other competent authority, for such respective periods as the trustees may from time to time determine; provided, that no indenture shall be for less than three years nor extend beyond the minority of the scholar.

"Each and every scholar shall be compelled to learn and be thoroughly instructed in one good mechanical trade, so that when they leave the school on the completion of their indentures they may be able to support themselves by the labor of their own hands. I leave it to the discretion of the trustees the selection of the several kinds of mechanical trades to be taught, and the determination of the particular one that shall be taught to and acquired by each scholar, but I particularly desire that the taste, capacity, intelligence, and adaptability of each scholar be ascertained and considered before assigning him to any particular trade.

"Among the trades which may be taught are those of a baker, blacksmith, bricklayer, butcher, cabinet-maker, car builder, carpenter, carriage-maker, coppersmith, the crafts of constructing, managing, and repairing electrical appliances and apparatus, foundryman, gasfitter, goldbeater, harness-maker, hatter, locksmith, machinist, marble mason, moulder, painter, paper hanger, pattern-maker, plasterer, plumber, printer, saddler, shoemaker, steam engineer, slater, stone-cutter, stone-mason, tailor, tiller, tinsmith, turner, wheelwright, and many others. In mentioning these several trades I

do not intend to make it obligatory upon the trustees to teach all of them, nor do I intend to exclude any of those which are not mentioned, and I authorize the trustees, to the extent that the cultivation, care, and adornment of the lands and grounds connected with the school will admit, to instruct such of the scholars as show taste and capacity for the occupation in the art of farming and gardening, or either.

"I desire and direct that the moral and religious training of the scholars shall be properly looked after and cared for by the trustees, but there shall be no attempt by the trustees at proselytism among the scholars, and no favoritism shown by the trustees to any particular sect or creed. I especially direct that each scholar shall be taught to speak the truth at all times, and I particularly direct and charge as an imperative duty upon the trustees that each and every scholar shall be thoroughly trained to habits of frugality, economy, and industry, as, above all others, the one great lesson which I desire to have impressed upon every scholar and inmate of the school is that in this country every able-bodied, healthy young man who has learned a good mechanical trade, and is truthful, honest, frugal, temperate, and industrious, is certain to succeed in life, and to become a useful and respected member of society."

Provisions are also made for the publication of the trustees' accounts in the newspapers in order that the condition of the institution may be full known, and it is further provided that a record shall be kept of graduates, showing their occupations and facts bearing on their success in the world for at least ten years.

THE RINDGE SCHOOL.

The object of the Rindge School, lately presented to the city of Cambridge, Mass., is thus indicated by the donor:

"I wish the plain arts of industry to be taught in this school. I wish the school to be especially for boys of average talents, who may in it learn how their arms and hands can earn food, clothing, and shelter for themselves; how, after a while, they can support a family and a home; and how the price of these blessings is faithful industry, no bad habits, and wise economy, which price, by the way, is not dear. I wish also that in it they may become accustomed to being under authority, and be now and then instructed in the laws that govern health and nobility of character. I urge that admittance to said school be given only to strong boys who will grow up to be able working-men. Strict obedience to such a rule would tend to make parents careful in the training of their young, as they would know that their boys would be deprived of the benefits of said school unless they were able-bodied. I think the industrial school would thus graduate many young men who would prove themselves useful citizens."

MORAL FEATURES OF THESE SCHOOLS.

It will be observed that both Mr. Williamson and Mr. Rindge discriminate as to the condition of the boys to be admitted to their respective schools. First, they are to be able-bodied; secondly, in the Williamson School there are to be taught those mechanical trades which will enable "those who, when arrived at manhood, will be obliged to labor with their hands for their support" to gain a livelihood, and all tending to unfit them for "their trades in the sphere of life in which their lots are to be cast" is to be avoided, and in the Rindge School the benefits are "for boys of average talents who may in it learn how their arms and hands can earn food, clothing, and shelter for themselves." At the Williamson School "each and every scholar shall be compelled to learn and be thoroughly instructed in *one good mechanical trade*," not in the underlying principles of *all trades*. Not only is the trade instruction to be definite, thus securing the graduate immediate rather than potential ability, but it is especially directed by Mr. Williamson that habits of frugality, economy, and industry be inculcated, as the one great lesson above all others which the founder desires to impress upon those for whom he is providing is "that in this country every able-bodied, healthy young man who has learned a good mechanical trade, and is *truthful, honest, frugal, temperate, and industrious*, is certain to succeed in life, and become a useful and respected member of society;" and Mr. Rindge says the same. It requires something more than a trade to succeed, those gentlemen think.

The two practical business men whose schools we have just spoken of emphasize industry, frugality, and honesty as the price—which, by the way, is not dear, says Mr. Rindge—of success. A third, also a founder of a recently-established industrial school, equally a public benefactor and a successful man of business—it will be remembered that we are not speaking of academic or peripatetic philosophers or those thinkers who, as Sir George Cornewall Lewis says, write history as though a popular assembly were not to be seen—would emphasize another, if possible, still more important element of success, and that is self-respect. The magnificent creation of Mr. Pratt "offers its advantages to those only who propose to do their own part earnestly and well. Its aim is to aid those who are willing to aid themselves. Its classes, work-shops, library, reading-room, and museum are for this purpose, and while tuition is required, yet it will be the endeavor to make possible by some means *consistent with self-helpfulness and self-respect* the admission of every worthy applicant."

THE PRATT INSTITUTE.

We have already spoken of the manual training department of this school when treating of the schools on the Russian system (see page 894). The institute as a whole will now be considered.

The institute has been established after many years of study on the part of the founder, Mr. Charles Pratt, of Brooklyn. Its object is to promote manual and industrial education, and to supplement the latter by advanced work in science and art.

It has been shown (p. 891) that the founder views manual training as education; and from what follows it will be seen that he favorably regards it as industrial education—the direct fitting of men and women for earning their daily bread; but it is doubtful if he believes in engrafting industrial education, perhaps even manual training, on the public school system. He says:

“The question of incorporating *manual training* into the public school system of the country has for years deeply interested educators, but there have been great practical difficulties to overcome in demonstrating the best way of accomplishing the work on a scale commensurate with its importance;” and then dismissing the subject of manual training immediately turns to the consideration of the industrial education, using this language: “The need of manual training as a developing power is scarcely less than that of industrial education—such education as shall best enable men and women to earn their own living by applied knowledge and the skilful use of their hands in the various productive industries. Accordingly, the institute seeks to provide facilities by which those wishing to engage in mechanical or artistic pursuits may acquire a thorough theoretic and practical knowledge thereof, or may perfect themselves in that occupation in which they are already engaged.”

By the side of the two-story building described on p. 895 as containing the metal and wood working shops, and connected with it, is the building, 103 by 95 feet and about 30 feet high, containing the Department of Building Trades. Work was commenced in February, 1888, with pupils in bricklaying, stone carving, plumbing, and modelling. In the bricklaying department the pupil is first taught to handle the trowel and spread mortar, and then put upon building walls, advancing to arches, etc. In stone carving the pupil is first employed in working out architectural ornaments, sketching and modelling them first. Fifty-four benches are provided for pupils in plumbing, attention being given to the hygienic features of the trade.

Had this volume a chapter devoted to schools of art, in it would properly fall an account of most of the work done in the main building of the Pratt Institute. This building is 100 by 86 feet and six stories high. Its first story is devoted to books and readers, the second to a lecture hall and to a reception and other incidental rooms, the third to art embroidery, dressmaking, and sewing, the fourth to drawing, painting, and modelling, the fifth to a technical museum, and the sixth to cooking and an art hall.

The library, at first intended merely for the students, contains 12,000 volumes, which are loaned to persons over 14 who have gone through a form of application easily accomplished, if the applicant be respectable. It was first opened to the public February 1, 1888, during which month 3,708 books were circulated. In April the circulation had grown to 7,408.

The sewing class numbered 24 when organized in February. An evening class was organized, and in April one for school children on Saturday. Instruction in all kinds of hand sewing is given. Three classes in millinery and three in dressmaking have been formed, and others in art embroidery contemplated. The rooms of the cooking school are upon the uppermost floor. The three day classes, of 25 each, are open to all; the evening classes are reserved to self-supporting women. There are three courses of 12 lessons each, and when they have been completed it is expected that the pupil will know not only the art but the science of cookery. In front of the cooking rooms is a lunch room where, for a small sum, a well served meal is furnished for the teachers and students of the institute.

The school of art and design occupies the entire fourth floor. “Drawing,” says the catalogue, “is fundamental; it is the basis of all the constructive industries, all pictorial art and decorative design. It is the one universal language, and its importance to the designer and artisan is only comparable with reading and writing. Its applications are various and almost innumerable; but the subject, considered as a whole, may be regarded as embracing three divisions, which include all the constructive, representative, and decorative arts, namely: Construction, as applied in industrial construction and the making of objects; representation, as applied in representing the appearance of objects and of nature; decoration, as applied in ornamentation. The purpose of this department is to give thorough and systematic training in each of these divisions, which may be specialized under the heads of freehand, mechanical, and architectural drawing, color, clay modelling, design, wood-carving,” etc. The first class of 12 was enrolled in October, 1887, and in January, the electric lighting apparatus being in place, evening classes were enrolled. In March the day classes numbered 133, the evening classes 174.

During the past year a plumbing class has been carried on of evenings in Washington, D. C., under the auspices of the Plumbers' Association, and through the courtesy of Mr. Auchmuty, of New York, we are informed that a trade school similar to his will be opened by the Builders' Exchange, in Philadelphia, January 2, 1889.

THE NEW YORK TRADE SCHOOLS.

"The New York trade schools," says the founder, "were established 7 years ago for the purpose of giving young men instruction in certain trades and to enable young men already in their trades to improve themselves."

"Since the New York trade schools were established a great interest has arisen in industrial training. Seven years ago but little had been written on technical education; it has now a literature.

"The master mechanics in various trades have, at their various association meetings during the past few years, advocated the establishment of trade schools as necessary for the proper acquiring of the trades. Since the plumbing class was opened at the New York school, plumbing schools on the same plan have been established by the master plumbers' associations of Chicago, Montreal, and Philadelphia. At the last convention of the National Association of Master Builders the report of the committee on apprenticeship, recommending that a lad should learn the science and practice of his trade at a trade school before being employed in the workshops, was unanimously adopted.

"The trades unions, thus far, have shown no interest in, or have been openly hostile to, technical education for boys or young men."

The requirements for admission are simple. The pupil must be between 17 and 21 years of age. During the year 469 pupils attended, distributed thus:

Plumbing.....	184
Bricklaying.....	120
Painting.....	33
Tailoring.....	31
Carpentry.....	28
Plastering.....	28
Stone-cutting.....	15
Blacksmithing.....	13
Wood-carving.....	12
Total.....	469

These pupils were instructed by 17 teachers for six months. Since the organization of the schools 1,643 have followed the courses.

The buildings are of brick and cover a plat of land 200 feet on First avenue and 112 feet on Sixty-seventh and Sixty-eighth streets. The tuition charge varies from \$12 to \$35 for the course. The apparatus is valued at \$1,000, and the property at \$120,000.

The receipts during the year from tuition fees were \$6,866; the expenditures for building, \$8,740; for salaries, \$2,657; for implements, \$1,310; for material, \$2,247, the deficit being met by the founder and proprietor, Mr. Auchmuty. Comparing the per capita cost of material used at this school, \$4.80, and that of the Baltimore school, \$2.50, of the Miller Manual Labor school, \$6.22, it would seem to be a mean between them.

NAUTICAL SCHOOL OF NEW YORK CITY.

The school system of New York City has had for some years a rather unique branch, the nautical school on board the ship *St. Mary's*. By an act of 1874 Congress authorized the use of certain naval vessels for school purposes and the detail of officers as instructors, providing that "no person shall be sentenced to or received at such schools as a punishment or commutation of punishment for crime." The *St. Mary's* is under the charge of the board of education and the council of the Chamber of Commerce. During the winter months instruction in common school studies and seamanship are carried on, and during the summer a cruise across the ocean is made for practice.

The graduating exercises of the school were held on October 13, at New York City, under the care of the council of the Chamber of Commerce. The boys were examined in practical seamanship and navigation by several sea captains, twenty-six receiving certificates. The report on the examination shows that the graduates were proficient in seamanship and sailmaking, and, with one or two exceptions, good navigators. Three-fourths have since embarked on merchant vessels. The ship can accommodate 120 pupils. During the year 112 were enrolled. The per capita cost is higher than in the other branches of the school system.

CHAPTER XVI.

COMMERCIAL AND BUSINESS COLLEGES—NURSES' TRAINING SCHOOLS.

I.—COMMERCIAL AND BUSINESS COLLEGES.

GENERAL REMARKS.

Two hundred and twenty-two institutions appear on our lists for the year under review, an increase of five over last year. Twenty-one report for the first time, and sixteen formerly reporting have either ceased to exist, or failing for several successive years to reply to inquiries addressed to them from this Office are presumed to be no longer in operation.

The following are the changes for the year in the names of institutions:

Location.	Name.	Changed to—
Bridgeport, Conn....	Gaffey's Short-hand School.....	Martin's Short-hand School.
Hartford, Conn.....	Gaffey's Short-hand School.....	Porter's Select School of Short-hand and Type-writing.
Sioux Falls, Dak....	Silsber's Business College.....	Sioux Falls Business College.
Davenport, Iowa....	Iowa Commercial Institute.....	Iowa Commercial College.
Ottumwa, Iowa.....	Ottumwa Business College.....	Ottumwa Business College and Normal Institute.
Madisonville, Ky....	National Institute of Mathematics ...	National Institute.
Elmira, N. Y.....	Elmira School of Commerce and Allen Business College.	Elmira School of Commerce.
Pittsburg, Pa.....	Curry Institute and Union Business College.	Curry University.
Waco, Tex.....	Waco Business College.....	Hill's Business College.
Milwaukee, Wis.....	Excelsior Business College.....	Wilmot Business and Short-hand College.

A new school has recently been organized at Freeport, Ill., and, with the Rockford Business College at Rockford, forms Rockford Business University. The Nelson Ladies' Business College at Cincinnati has been consolidated with the Nelson Business College.

There is a marked tendency among the better class of these institutions to improve the courses of instruction, making them more thorough and practical. By genuine business transactions the student becomes practically familiar with commercial operations of all kinds. "He buys and sells merchandise, real estate, etc.; receives and forwards goods to be sold on commission; gets insured; deposits in bank; gives and receives checks, receipts, orders, notes, drafts," etc. Curry University, formerly known as Curry Institute and Union Business College, has in addition a collegiate course of four years, Latin, Greek, and mathematics being taught throughout. The St. Stanislaus Commercial College, at Bay St. Louis, Miss., requires candidates for graduation to pass a satisfactory examination in mathematics through trigonometry, in book-keeping, and in commercial law. There is a post-graduate course in the "higher mathematics," comprising conic sections, calculus, navigation, etc. French, German, and Spanish are also taught in this institution.

To supply the increasing demand for stenographers, schools of short-hand and type-writing have been established in various parts of the country, and, with few exceptions, all business colleges now have a "department of short-hand." A number of systems are taught, but that of Ben Pitman is more generally used than any other in this country, and may be called the "American system." According to reports of principals the length of time required to fit the average student for the satisfactory discharge of the duties of stenographer is from six to eight months, but many institutions profess to accomplish that result in a much shorter period.

The number of students reported in business courses of city, normal, and secondary schools, and of colleges, is 19,683, an increase of 4,099 over last year.

II.—NURSES' TRAINING SCHOOLS.

GENERAL REMARKS.

The training school connected with the Bellevue Hospital in New York City, established in 1873, was the first institution of the kind opened in this country. The object of its establishment was to educate a body of skilled nurses, suitable for the needs of hospitals and capable of being intrusted with the care of the sick at their own homes. During the same year schools similar in character were opened in New Haven, Conn., and in Boston, and their number has now increased to thirty-three.

Students attend lectures on anatomy, physiology and hygiene, obstetrics, and the principles of nursing and care of the sick, in addition to their training in the hospitals at the bedside of the patient. During the second year of the course they are sent to nurse in private families or in hospitals, as superintendents may think best. Examinations are held at stated periods to ascertain as nearly as possible the progress of each individual student, and her fitness for the work.

Evidence of a good common school education is a qualification essential for admission, and age limitations are fixed at from twenty to forty, or, in some of these schools, from twenty-five to thirty-five. During the year 1887, 386 applications for admission were received at the Bellevue training school, showing how large is the number of women who wish to avail themselves of this training. Of these applications 47 were accepted, preference in every case being given to women of superior education and acquirements.

Reports from these schools show that the demand for their graduates, both for private nursing and as superintendents and assistant superintendents of hospitals, largely exceeds the supply, and bears testimony to the excellence of the training received.

A training school for male nurses, in connection with New York City Charity Hospital, has been in existence one year, and, with the same object in view, a building has lately been erected on the grounds of Bellevue Hospital at a cost of \$100,000; Mr. D. D. Mills, of New York, was the donor.

The superintendent of Bellevue training school reports an application from Persia, and also one from Japan, for admission to that school, and a movement is on foot to establish in India a school for native women, to be educated by trained nurses and physicians.

The South Carolina training school, located at Charleston, has been inactive since 1886, from lack of funds for its maintenance.

CHAPTER XVII.

EDUCATION OF SPECIAL CLASSES.

EDUCATION OF THE DEAF.

GENERAL REMARKS.

New institutions and buildings.—The Cathedral School for the Deaf at Cincinnati, Ohio, the dual institution for the colored at Austin, Tex., and Miss S. W. Keeler's articulation class in New York City are the new institutions reported in operation during the past year. The Cincinnati institution is under the control of the Archbishop of Cincinnati, and is in part supported by him. The manual method of instruction is followed at present, but the combined system is soon to be introduced. The new school in Wyoming, reported last year as ready to begin work, has failed to respond to inquiries from this Office. The Deaf-Mutes' Journal, a paper published in New York, is authority for the statement that a Chicago merchant proposes to give \$20,000 toward the establishment of an institution in which deaf-mutes shall receive "suitable training." The method of instruction to be adopted is not mentioned. A bill was introduced in the State senate of Ohio by Mr. Mack, of Cincinnati, during the last session of the Legislature, to establish schools for deaf-mutes in the city school districts of Cincinnati and Cleveland. Action was postponed until the next session.

A home, the "Sarah Fuller Home for Little Children who cannot Hear," was recently established at West Medford, near Boston, Mass. The oral method of instruction is employed. "It is not proposed to retain these children in the home after they are old enough to go to the Horace Mann School, only to prepare them for that and to utilize their earliest years before the organs of speech have lost their elasticity."

Another institution, known as the "Frentz School for the Deaf," enters upon its first year of existence at Oshkosh, Wis. The manual method is to be adopted, and the institution is supported by the State.

A private school, the "St. Mary's Institution for Deaf-Mutes," was opened during the year in St. Paul, Minn., but no report of its work has been received.

The main building of the Missouri institution at Fulton was destroyed by fire in February last, and is being reconstructed on an improved plan.

The Pennsylvania oral school at Scranton will soon have accommodations for forty additional pupils, and the Legislature of Washington Territory has appropriated \$30,000 for new buildings for the school at Vancouver.

Changes of the year.—The board of trustees of the Iowa institution at Council Bluffs has placed the educational and business departments under separate and independent heads. The system of double classes is abandoned, and the length of the school day increased by one hour spent in the school-room. The Cincinnati oral school has become a part of the public school system of that city, and is governed by its laws and regulations.

Methods.—By invitation of the "Royal Commission on the Blind, the Deaf and Dumb," etc., Dr. Alexander Graham Bell went over to England during the past summer to give the commission information about American schools. A short time before his departure Dr. Bell sent a circular letter to the superintendents and principals of American and Canadian schools for the deaf, asking for information as to methods employed in their institutions, and for opinions on the various methods and on other points of interest and importance. The replies were collected together and published. Thirty-nine American schools reported the combined method; 16 purely oral; 8 manual; 3 manual and oral, and 1 manual, oral, and combined; 43 schools report 2,308 pupils in articulation, and with 1,333 of this number articulation is used as the means of instruction; 855 are congenitally deaf, or became deaf before two years of age.

Auricular instruction.—The attempt to cultivate and improve the hearing of the deaf by this method of instruction is rapidly growing in favor. Eight years ago an experimental class of semi-deaf was organized in the Nebraska Institute for the Deaf and Dumb, and the results proved satisfactory. The superintendent of this institution, in reply to Professor Bell's circular letter of inquiry, says: "We have sixteen (pupils) under aural instruc-

tion; of these, nine will leave school as hard-of-hearing speaking people, with perhaps no greater degree of disadvantage from deafness than those who have become partially deaf in adult life.

"After eight years of experience in this work and of observation elsewhere, it is my belief that at least 15 per cent. of our deaf-mute population are fit subjects for aural instruction, and that a majority of these can be graduated as hard-of-hearing speaking people, and the condition of the remainder greatly elevated above that of the ordinary deaf-mute.

"As to what takes place in a scientific point of view in aural work, my opinion is that in some cases there is a development in the hearing power, as well as improvement due to an increased knowledge of spoken language. In the majority of cases I think it proper to say that there is an improvement in both directions."

He regards the small class-room bell as the best means of testing the hearing power of pupils, and thinks the ordinary flexible tube superior to the audiphone as an artificial aid, the value of the latter depending upon "the cause of deafness and condition of the auditory nerve and of the teeth."

Prof. E. H. Currier, of the New York Institution for the Deaf and Dumb, in reply to Professor Bell's inquiries, says: "The work of developing the latent hearing of such pupils as we find, upon careful examination, possess any appreciation of sound, has been carried on in this institution for nearly two years with the most gratifying as well as the most convincing results.

"That the hearing power is increased I will not claim, but it is certain that voice sounds are more readily recognized and interpreted after a systematic course of aural training. * * *

"About 17 per cent. of our pupils have the ability to comprehend sounds to a degree sufficient to warrant the training of the auditory apparatus to perform, with instrumental aid, the functions which belong to the organ of hearing in its normal condition."

Nineteen of the institutions for the deaf give aural instruction, and 274, or about 3½ per cent. of the whole number of the deaf under instruction in the institutions of the United States, receive some training by this method.

Several interesting operations for deafness by excision of the drum-head were performed by Dr. Samuel Sexton, of New York, and reported in the Medical Record of December 31, 1887. In the five reported cases in which deafness was due to various causes the results were very satisfactory, the hearing power in each case being greatly increased. It is believed that certain forms of deafness will henceforth be removable.

Convention.—The Sixth Conference of Principals and Superintendents of American Institutions for the Deaf was held at the Mississippi institution, Jackson, Miss., April 14-17, 1888. The published report of the proceedings has not yet been issued, but we quote from a brief notice of the convention which appeared in the July number of the "American Annals of the Deaf." "The attendance was the largest of any conference that has yet been held, numbering twenty-four regular and thirty-four honorary members, representing twenty-four States and the Dominion of Canada. Among the honorary members were several trustees and directors of institutions.

"Mr. J. L. Noyes, superintendent of the Minnesota school, was the president of the conference, and Mr. S. T. Walker, superintendent of the Kansas institution, secretary.

"The principal subjects of discussion, including several valuable papers, were moral and religious instruction, the acquisition of verbal language, auricular training, the relations of trustees and superintendents, and of superior and inferior officers, the importance of thoroughness in primary instruction, the legal relations of the deaf, and day schools. The session of Sunday evening was devoted to a memorial service in memory of Thomas Hopkins Gallaudet. * * *

"The members of the conference were entertained with genuine Southern hospitality by Mr. Dobyns and his associates of the Mississippi institution, and the occasion was in all respects exceedingly pleasant both for guests and hosts."

NOTES FROM CATALOGUES, RETURNS, ETC.

COLORADO.

Colorado Institution for the Education of the Mute and Blind, Colorado Springs, Colo.—Instruction is given in aural development in this institution, and more time is devoted than formerly to articulation and lip-reading.

CONNECTICUT.

American Asylum for the Education of the Deaf and Dumb, Hartford, Conn.—A legacy of \$500 was left to this school by the late Rev. W. W. Turner, the income from which is to be expended annually for prizes to the graduating class. Pupils over twelve years of age are given three hours' daily instruction in cabinet-making, shoemaking, and tailoring.

DISTRICT OF COLUMBIA.

National Deaf-Mute College, Washington, D. C.—Six young women were admitted to this institution during the past year, in accordance with the recent decision to admit female students for an experimental period of two years. They represent the States of Illinois, Indiana, Maryland, Nebraska, and Pennsylvania. They are under the charge of the matron of the institution, who lives with them in the president's house, and they recite with the young men of the introductory class.

INDIANA.

Evansville Deaf-Mute Institute, Evansville, Ind.—At present this school is supported by municipal appropriation, and instruction is given by the manual method. It is, however, soon to become a State institution, and the "combined method" will be introduced. The older pupils are prepared for admission to the National Deaf-Mute College, at Washington, D. C. No provision is made for industrial training.

MASSACHUSETTS.

Horace Mann School for the Deaf, Boston, Mass.—An act of the State Legislature of April 19, 1883, authorizes the Governor to provide for the travelling expenses of deaf children attending school. Auricular perception is cultivated to a limited extent in this institution; each teacher endeavors to train the hearing of the pupils in her class by raising the voice, at the same time directing their attention to her lips.

NEW MEXICO.

New Mexico School for the Deaf and Dumb, Santa Fé, N. Mex.—The manual method of instruction is wholly followed in this institution. It is hoped that the next Territorial Legislature will make appropriation for new buildings, the present quarters not being adapted to the needs of the school. No provision is made for industrial training.

NEW YORK.

New York Institution for the Instruction of the Deaf and Dumb, New York, N. Y.—The method followed in this school is the combined. The course of instruction goes beyond the grammar grade of public schools; mental and moral science, chemistry, astronomy, Latin, Greek, mathematics, etc., are taught.

PENNSYLVANIA.

Pennsylvania Institution for the Deaf and Dumb, Philadelphia, Pa.—There has been a change in the method of instruction in this institution during the past year; the manual and oral departments now form two separate and distinct schools under the same general management. Hitherto the method pursued has been the general instruction of all pupils by signs with special training of a part of them in articulation and lip-reading. Carpentry, shoemaking, tailoring, printing, etc., are taught.

WISCONSIN.

Wisconsin School for the Deaf, Delavan, Wis.—A cottage has been reconstructed and fitted up as a hospital and home for the younger boys. The combined method is employed and instruction is given in carpentry, shoemaking, printing, etc.

Milwaukee Day School for the Deaf, Milwaukee, Wis.—This institution belongs to the city public school system and also receives State aid. The controlling body is the board of city school commissioners and the State superintendent of education. The method of instruction is oral.

EDUCATION OF THE BLIND.

GENERAL REMARKS.

New institutions.—The dual Institution for Colored Deaf-Mutes and Blind at Austin, Tex., began its work in the fall of 1887. Its management is wholly independent of the older institution, also located at Austin. Mr. W. H. Holland is superintendent. Building accommodations on the "cottage plan" are provided for fifty pupils, and a hundred acres of rich land are the property of the school.

A legacy of \$25,000 was left for the establishment of an institution for the blind in western Pennsylvania, provided that an equal sum for the same purpose be subscribed by citizens. This amount has been raised, and owing to rapid increase in value of the property representing the original legacy the sum of \$75,000 is now at the disposal of the gentlemen in charge of the funds. It is proposed to locate the school within easy reach of Pittsburg.

No report has been received from the Wyoming institution, which was prepared to begin work in October, 1887.

Systems.—Mr. Battles, of the Pennsylvania institution, in his report for 1887, says: "A year or more ago we commenced a series of careful, exhaustive, and unprejudiced tests relative to the comparative tangibility of line and point letters. The pupils were taken individually and their speed per minute recorded. In the first test, which was entirely in line, a large number, in fact about 25 per cent. were found unable to read at all, and of the others many read very slowly and with great difficulty.

"Six months later another trial was made; in the mean time those unable to read had been placed in New York point; at this time all could read with more or less fluency either in line or point.

"The fact is the line letter has been over-developed; its very advantage of compactness having been gained at the expense of its tangibility, until now it can be taught only to the young, and even those who have learned it lose the power of distinguishing the letters when they follow any industrial pursuit. On the contrary, we have found no one unable to distinguish the point letters, and generally after but little instruction. In addition to which the ability to *write* as well as *read* a system places the blind more in equality with the sighted; their slates and stylus acting the part of pen or pencil, enabling them to take notes, point their lessons, and incidentally aiding materially in an objective method of improving their spelling, in which they are commonly deficient.

"This, in addition to the fact that but 9 per cent. are of educable age, leads us to the conclusion that it would be wisest to confine the literature of the blind entirely to point."

Mr. Rainey, of the Texas Institution for the Blind, advocates the establishment in each State of a working home and retreat for the blind of both sexes, where the intelligent could work for wages and those unable to help themselves could be properly cared for.

At the ninth biennial meeting of instructors of the blind a committee of thirty-three was appointed to push forward the matter of establishing a college for the higher education of this class. The tenth biennial meeting was held at the Maryland institution during the past summer, but the proceedings are not yet published and we are uninformed as to the results of the efforts of this committee.

NOTES FROM CATALOGUES AND RETURNS.

CALIFORNIA.

Institution for the Deaf and Dumb and the Blind, Berkeley, Cal.—The course of instruction in this institution is carried somewhat beyond the grammar grade of public schools. The New York point and Howe's Boston raised print are used. Twenty of the thirty-one pupils receive instruction in vocal and instrumental music three hours daily. No provision for industrial training for the blind is at present made.

ILLINOIS.

Illinois Institution for the Education of the Blind, Jacksonville, Ill.—The Wait point system has been adopted in school work and musical notations. Stenography and type-writing are to be taught, and drill work has been introduced and is conducted by an expert drill master.

MARYLAND.

Maryland School for the Blind, Baltimore, Md.—This institution is controlled by a board of directors, eighteen in number, elected annually. It is designed for the education of blind persons between the ages of seven and eighteen years, and those who are only partially blind are also received. The course of instruction is continued somewhat beyond the grammar grade of the public schools. Point and line systems are in use.

Pupils are trained in tuning, chair-caning, broom and mattress making, etc. The establishment of a kindergarten is recommended, and the superintendent in his printed report calls special attention to the need of a gymnasium.

OHIO.

Ohio Institution for the Education of the Blind, Columbus, Ohio.—This institution completed its fiftieth year of existence in July, 1887. Five pupils were present at its opening, a number which had increased to two hundred and fifty on June 1, 1888. The course in the literary department includes kindergarten work and the regular high school course of studies. Vocal and instrumental music are taught, and considerable attention is given to instruction in tuning. Up to November 15, 1887, nine young men had been graduated as "tuners;" of these, five are reported as doing a "fine business," and two are engaged in the sale of musical instruments, and find their knowledge of tuning a great help to them. Instruction is also given in broom-making, chair-caning, etc.

OREGON.

Oregon Institute for the Blind, Salem, Oregon.—Hitherto there has been no provision for industrial training in this school, but during the past year a beginning was made, by the introduction of broom-making, and the superintendent hopes to enlarge this department in the future, as means become available.

PENNSYLVANIA.

Pennsylvania Institution for the Instruction of the Blind, Philadelphia, Pa.—An act was passed by the last State Legislature, extending to twelve years the time during which pupils may be maintained at this institution at State expense. Heretofore no pupil has been received under ten years of age, but the recent law makes the length of residence practically unrestricted, and children are now admitted at five years of age. The principal, in his report for 1887 to the board of managers, calls attention to the overcrowded condition of the school-rooms and dormitories, making it impossible to separate properly the sexes and pupils of different ages.

VIRGINIA.

Virginia Institution for the Education of the Deaf and Dumb and of the Blind, Staunton, Va.—The board of directors constituting the controlling body, formerly seven in number, now consists of nine members. Three were appointed for one year, three for two years, and three for three years, thus constituting a continuing board, of which three are appointed each year for a period of three years. The principal expresses the opinion that this change "will be found advantageous in giving more of a settled character to the policy of the institution."

EDUCATION OF THE FEEBLE-MINDED.

GENERAL REMARKS.

A private school, opened at Millville, N. J., in September, 1887, was on March 1, 1888, removed to Vineland, and is now known as "The New Jersey Home for the Education and Care of Feeble-minded Children." It is controlled by a board of directors, with Rev. S. O. Garrison as superintendent. The institution has the cottage system.

Mainly through the efforts of Mr. Garrison, a law was enacted by the Legislature of New Jersey in March, 1888, providing for the establishment of a "home for the care and training of feeble-minded women." Vineland was selected for its location, and Mr. Garrison appointed superintendent. It is now open for the reception of patients, and is similar in character to the institution at Newark, N. Y.

A school was in April last organized in the "Brunswick Home," at Amityville, N. Y. This "home" is for the reception of "idiotic, epileptic, paralytic, nervous, and feeble-minded persons of both sexes," and patients are received who have been rejected by all other institutions. It is constructed on the cottage plan. The school is designed for the instruction of those patients who possess sufficient capacity to learn. Special attention is given to instruction in singing, and the drawing class is free to all.

Mrs. E. M. Seguin, widow of the late Dr. E. C. Seguin, has successfully carried on in New York, a private school for the feeble-minded, which was established by Dr. Seguin in 1878. It appears this year for the first time, in our Reports.

A new building is now in course of construction at the Nebraska Institution, which will increase the capacity of that institution to one hundred and thirty. Seventy-three were present on June 1, 1888. It is hoped that the next State Legislature will make appropriation for an industrial department.

The Kansas State Asylum for Idiotic and Feeble-minded Youth was transferred in March, 1887, from Lawrence to Winfield. "The board of trustees have resolved to enlarge the scope of the institution, and render it an asylum in fact as well as a school, making provision for the cases of profound idiocy."

Dr. A. C. Rogers, the superintendent of the Minnesota school for feeble-minded, at Faribault, says: "We have developed what we know as the 'coördinate' system of training * * * viz: The 'dovetailing' of school-room and manual training occupations. We think that the pupils do *better* in the school-rooms under this system, besides developing decided ability for industrial pursuits."

^a Number present June 1, 1888.^b Of these eight inmates only four are feeble-minded.^c Includes appropriation for deaf and blind.

REFORM SCHOOLS.

NOTES FROM CATALOGUES AND RETURNS.

COLORADO.

State Industrial School, Golden, Colo.—Thirty-five acres of tillable land were added to this institution during the past year and a girls' department established. The inmates are divided into five families, according to size and age, the girls forming one family.

CONNECTICUT.

Connecticut State Reform School, Meriden, Conn.—This school is now conducted on the cottage system. In his report for the year ending June 30, 1888, the superintendent, speaking of the improvement evident in the institution, says: "This most desirable change could never have been accomplished without the adoption of the cottage plan, a plan which was new to Connecticut, but was no experiment with your superintendent, for a practical experience of twenty years previous to entering the Connecticut school had demonstrated its utility, correctness, and practicability as the best system for reformatory purposes. * * * Universal satisfaction now exists with the system wherever it has been tried."

LOUISIANA.

Boys' House of Refuge, New Orleans, La.—The reformatory work of this institution is much impeded by the failure of the State Legislature to enact a law regulating the length of term of commitments. It is supported by municipal appropriation and funds from other sources, the State having made no provision for its maintenance. The institution has a well-equipped shoe factory, the revenue from which pays the employes engaged to instruct the boys.

MASSACHUSETTS.

Plummer Farm School, Salem, Mass.—A carpenter shop has been added at this institution, and boys are taught the use of tools, cane-seating, gardening, etc. The cottage system is followed.

Lyman School for Boys, Westborough, Mass.—The school is made up of five families or cottages, each cottage having from twenty-five to thirty occupants. Classification is based on degree of "hardness," age, and state of advancement in school work. Carpentry and cane-seating are taught, and provision is made for eight boys in the printing office.

MICHIGAN.

State Industrial Home for Girls, Adrian, Mich.—By a change of regulations girls under ten years of age are not now sent to this institution. Inmates are classified as far as possible according to moral fitness and are promoted to higher grades as improvement is shown.

NEW JERSEY.

New Jersey State Reform School, Jamesburg, N. J.—The law has been so amended that boys under sixteen years of age are committed to this institution for all crimes except murder. The superintendent urges the establishment of a reformatory for delinquents between the ages of sixteen and twenty-five, for whom this school does not provide, and who are now sent to jails and the State prisons.

NEW YORK.

New York State Reformatory, Elmira, N. Y.—By recent action of the State Legislature prohibiting the employment of inmates of prisons at productive industries, the workshops of this institution are closed. "For exercise" the inmates have been formed into companies, and regular military drill and training introduced.

New York Juvenile Asylum, Randall's Island, N. Y.—Children, male and female, between the ages of seven and fourteen, are committed to this institution, and many are also voluntarily placed here for training by parents and guardians. The institution is conducted on the congregate system, but inmates are classified according to age, character, and ability. Carpentry, shoemaking, tailoring, farming, etc., are taught.

OHIO.

Cincinnati House of Refuge, Cincinnati, Ohio.—Measures are being taken for the introduction of an "industrial training school" into this institution.

PENNSYLVANIA.

House of Refuge, Philadelphia, Pa.—The boys of this institution are to be removed to the country; the site for the erection of necessary buildings on the cottage plan is already purchased, and \$300,000 in hand for that purpose.

RHODE ISLAND.

Lockanossct School for Boys, Howard, R. I.—By the provision of a separate workshop the younger boys are entirely isolated from the older at all times. The classification of inmates is based altogether on age. Printing, tailoring, etc., are taught.

WISCONSIN.

Wisconsin Industrial School for Girls and Young Boys, Milwaukee, Wis.—The last State Legislature imposed on this institution a penal character not contemplated by its founders, as set forth in the act of incorporation. The inmates are classified into four families, the classification based on moral character and age, and the school-rooms are graded after the plan of the public school.

NOTE.—The "House of Shelter" at Albany, N. Y., has ceased to exist.

The "House of Refuge" at Louisville, Ky., and the "Female House of Refuge" at Baltimore, Md., have also probably been discontinued, as no report has been received from these institutions for several years.

d Biennial appropriation.

e Biennial expenditure.

V.—EDUCATION OF THE COLORED RACE.

In presenting for the second time the section of this chapter which deals with the education of the colored population of the Southern States, we can only repeat that the object of the section is to bring together and within a small compass the statistics of institutions devoted to the education of the colored race. No elaborate work in the domain of ratios is attempted, we are too far from the last census for that. Nor are any ingenious statistical hypotheses made, for we are too near the next census for that. Our statistics are simple, as they well may be, since the matter with which they deal has been surveyed from every possible point of view, has again and again been presented in every conceivable statistical way, has again and again been passed upon by one of the branches of the national legislature, and has been neglected rather than defeated in the other. We doubt if there is a journal or review that has not contributed to making the subject one of the most thoroughly ventilated in the land.

Three agencies have been operating to accomplish the education of the class of persons under review—the efforts of the Southern States themselves, religious associations at the North, and the Peabody and Slater Funds. To the first of these are to be attributed the public schools; to the second the many so-called colleges, normal schools and universities. The income of the Peabody Fund has been mainly devoted to training teachers, and that of the Slater Fund entirely to fostering industrial and professional training.

PUBLIC SCHOOLS FOR THE COLORED RACE.

* For 1886-87.

a Exclusive of city and separate city school districts.

b Based on enrolment.

c Counties only.

d Colored teachers; number teachers of colored schools not given.

In commenting on the three tables, which are in reality but so many parts of one, we premise that their lack of complexity, and the obvious and, we hope, logical manner of arranging the columns in each, will relieve us of the necessity of any remarks except upon the statistics as a whole. The statistics are not all for the year 1887-88, and in any general remarks upon them this must be taken into consideration. The censuses are not all for the year 1887-88 nor for the year before nor the year before that; this too must be considered.

Let us exclude from the body of the statistics given in Columns 4 and 5 of Table 98, the statistics of States falling in either of two categories; first, those not reporting for the year under review, and, second, those having taken no census since 1885. This excludes the statistics of Delaware, Kentucky, Louisiana, Maryland, Mississippi, Missouri, South Carolina, Tennessee, and Virginia. We have then approximately accurate figures when treating of the relation that the enrolment of the other States bears to their present school population, something that represents the statistics of 1887-88.

The school population, white and colored, of those States which are not excluded as above is 3,668,613, and of this, 27.59 per cent. are colored. But in this calculation the statistics of Indiana and of West Virginia are included, though in both States the percentage of the colored school population in below 5 per cent. Excluding the statistics of these two States the ratio of the colored population of school age to the total school population is 37.06. Last year it was 36.85, though in the effort to cover all the ground statistics of States were admitted in that computation that we have not scrupled to throw out in this.

Now, what per cent. of these 37 colored persons in every hundred of school population is enrolled? We find it to be 53.27. In obtaining this we have used the enrolment for last year in the case of Florida and of Alabama. The total average attendance we cannot give for reasons that will suggest themselves to those who are familiar with the proper manner of obtaining that most important of all statistics of education.

But though the bases, or one of them, for obtaining statistics of the average attendance of the colored race are wanting, we have still an interesting comparison to make with the absolute figures (the average attendance being a relation) of enrolment. What part of the total enrolment, white and colored, is the colored enrolment? The answer to this, including the statistics of one State which are very unsatisfactory, is 33.06 per cent. Somewhat below the ratio of the colored population to total population, which we have shown is 37.06 per cent. It will be understood that we are using the statistics of the same States in obtaining these two ratios.

To make this plainer we will tabulate the statements just made:

Of the population of school age in the 9 States whose statistics have been used—	Per cent.
The white population of school age comprises.....	72.41
The colored population of school age comprises.....	27.59
Or, excluding Indiana and West Virginia—	
The white population of school age comprises.....	62.94
The colored population of school age comprises.....	37.06
Of this last white population of school age there is enrolled.....	63.54
Of this last colored population of school age there is enrolled.....	53.27
Of the total white and colored enrolment of 9 States the colored enrolment comprises	33.06

Only in one instance does the ratio of enrolment to school population (Columns 5 and 6 of Table 98) show better for the colored than for the whites, and that instance is where provision is made in part by the national government; for in the District of Columbia half of the expense of school affairs is provided by Congress. In considering this exception, however, it is to be carefully borne in mind that the city of Washington amounts to very much the same thing as the District, and it is too obvious to remark that it is in cities that school affairs can reach or perhaps, as we should say more hopefully, have reached their highest usefulness. In average attendance (Columns 7 and 8) the ratio for the races is much nearer, and as to number of days of schooling there is little or no difference.

As to average monthly salary of teachers there appears but little difference as far as the figures go. As to pupils to a teacher, with an exception or two, there appears to be an equality.

PRIVATE BOARDING SCHOOLS.

CHARACTER OF THE INSTRUCTION.

In our last report we spoke of the elementary character of these schools as exhibited by an examination of their catalogues. Since then we have received information on this point, which we will quote from most fully.

"Three years ago," says the agent of the John F. Slater Fund in his report for 1888, "there was occasion to make a careful investigation of the studies pursued in the higher

schools for colored people in the South. At that time in twenty-three of the leading schools for colored there were enrolled 7,273 students. By actual count it was found that less than five per cent. of the whole number were engaged in what are considered as classical studies. The rest are learning just those things that a people must first learn—the rudiments of learning—learning what will enable them to read, to write, to keep accounts, and to begin to think; learning what will prepare the best of them to teach in the common schools for their own people. It is because the colleges and higher schools are really teaching what they ought to teach that there are more than 15,000 public schools for colored children, taught by colored men and women in the South at this time. It is true that many of these schools are inferior; it is also true that many of them are as good as any in the country. What is here set forth explains the marvellous fact that about two millions of the colored people can read to-day—twenty-three years after the revolution that set them free.

"This should be added: More and more those who direct the training schools are shaping their plans to ascertain facts, and less to theories. So it will come to pass that the true theory of this work is being evolved by experience."

It thus appears that Dr. Haygood looks upon these institutions as schools for training teachers, and to this we would add (if we may supplement this authority) for training preachers, who are, after all, but teachers—teachers of men. In this consists the great usefulness of this class of schools; for seats of learning, which their name of college or university would appear to indicate, they, in general, are not. Nor does there appear to be as yet a demand for such institutions that is not being supplied by higher institutions in Northern or Western States at least, if not in several instances at home.

PROFESSIONAL SCHOOLS.

Regarding the work of the medical schools of this class, we will use the reports of the principals of two of them to bear witness to its success. President Tupper, of Shaw University, of which the Leonard Medical School is a part, observes in a late report :

"Teachers and students have been enthusiastic in their work. Good will and harmony have characterized the year's work. All the students are professing Christians, and are doing their best to prepare themselves for usefulness in their chosen profession. Our greatest difficulty is to find young men sufficiently qualified to enter upon the study of medicine, and thus be able to graduate at the end of a four years' medical course.

"To determine where the dividing line should be drawn, on the one hand to maintain a standard that shall not be beyond the average medical student, and at the same time meet the rigid requirements of medical boards of such States as North Carolina and Virginia, is a matter not easily settled. We are anxious to encourage the student in his endeavor to obtain a medical education, while we are compelled, from a sense of duty and the circumstances which environ us, to maintain a standard to which some of our medical students will probably never attain.

"Our former graduates in medicine have more than met expectations. They have readily entered into a good practice, winning the confidence of the colored people and the respect of the whites, and everything indicates that the colored physician will constitute an important factor in the education and elevation of the race."

Dr. Hubbard, dean of the Meharry Medical College of Nashville, Tenn., says:

"The past year has been in many respects the most prosperous ever enjoyed by this college. The number of students enrolled was fifteen per cent. greater than that of any previous session, and the graduating class, eighteen in number, was nearly twice as large.

"The success of our graduates has been most gratifying. Of the eighty-six living graduates one is secretary of the S. S. department of the A. M. E. Church; one is State missionary of the Baptist Church for South Carolina; two are in the employ of the United States Government; one is a professor in Livingstone College, North Carolina; three are pastors of churches; six are engaged in teaching, and seventy-two are practicing medicine. Several of those above mentioned as engaged in other occupations are also practicing their profession of medicine.

"Bishop W. F. Mallalieu, who has travelled extensively in the southern States during the past four years, recently stated that in the fourteen cities and towns which he has visited, where our graduates are located, he found that they were all doing well, and some of them exceedingly well.

"They have been treated with remarkable kindness and consideration by the white physicians, who frequently offer to loan them books and instruments, consult with them in dangerous cases, and assist in difficult surgical operations.

"Four of the graduates of the present year have passed successfully the examination of the State Medical Board of Arkansas, and received license to practice in that State.

"The school of dentistry has progressed favorably. Twelve students have been enrolled during the past session, and two received the degree of D. D. S. at our last commencement.

"At the annual meeting of the American Association of Dental Faculties, held at Washington, D. C., September, 1887, this school was admitted to membership by a unanimous vote; and this action places our graduates on an equal footing with those of other dental colleges.

"A new building is greatly needed for furnishing additional facilities for teaching dentistry and for opening a school of pharmacy. Plans have been prepared for this edifice, and efforts are now being made to secure the necessary funds for its erection."

a Ten of these are in a course leading to the degree of A. B.

The only school of law that reports statistics for the year under review is the law school of Allen University of South Carolina, which reports 2 non-resident instructors (the resident instructors not being given), and 160 different students enrolled. In the report of the agent of the John F. Slater Fund we find statistics of two medical schools. Of these the Leonard Medical School, Raleigh, N. C., had 7 lecturers, 36 students, and expended \$4,000, derived from fees (\$1,500), Slater Fund (\$500), and contributions from the North (\$2,000). The other school, the Meharry Medical College, Nashville, Tenn., had 11 lecturers, 62 students in medicine, and 12 in dentistry, receiving from the Slater Fund \$1,000, other figures not given.

INDUSTRIAL EDUCATION.¹

Three institutions have been added during the year to the list of those aided by the John F. Slater Fund, which now has 44 schools as beneficiaries, two of which are for medical students. The income, \$45,000, is distributed for the most part in sums ranging from \$500 to \$1,000, and in three cases going as high as \$2,000. Of these schools 35 are known to be supported by missionary enterprise, including the work of the Freedman's Aid Society as such.

In another chapter of this volume we have carefully endeavored to distinguish between manual training and industrial training. Now which form of work is obtaining in the case of the colored man? As the trustees of the Slater Fund distribute \$45,000 among a majority of the institutions in the South for the education of the negro, and this distribution is specifically to foster hand training, the opinions of their agent through

¹ See also circular No. 5, 1888, of this Bureau, "Industrial Education in the South," by Rev. A. D. Mayo.

whom the money is distributed and by whom the institutions to be benefited are selected is of considerable importance. He recently said:

"Many things have shown me that some of the best friends and supporters of the schools for negroes in this country look with a degree of apprehension upon the almost universal prevalence of the industrial element in their work. Some fear that the workshop will hinder the recitation room. In the absence of facts, this is perhaps a perfectly natural view that should not be surrendered without evidence that it is ill-founded. For the moment, granting (what is very far from the truth) that the workshop does hinder the school-room and abridge book-learning, there are some very important matters to be considered before deciding that the shop should be closed.

"1. What I do not now dwell upon, the need of more skilled labor among the colored people for their own good and the obvious fact that the industrial departments in these schools afford not only their best, but nearly their only opportunity to learn the use of tools. Practically, the apprentice system is a thing of the past; where it survives, it is impracticable for negroes.

"2. Considering the poverty of these people, unless they are to be absolutely carried by friends, if they are to have the opportunity of learning books, it is needful that they have the opportunity also of earning some money while at school. If there were money enough at the command of these schools to satisfy every poor boy's wants with 'student aid,' this would not meet the case. 'Student aid' may be given—and many times has been given—in such way as to destroy self-reliance. Better have a strong man, ignorant of books but capable of taking care of himself, than a weak man, full of book knowledge who can only live—on other people. 'Student aid' is good when it stimulates effort, or gives a start to a worthy youth; it is a very bad thing when it enervates resolution and breeds dependence. An educated, lazy, incapable negro is a very poor man, for he has tastes that call for hundreds with ability to earn only tens.

"The industrial department in negro schools in the South enables hundreds of students to earn money enough, with what they can make during vacation, to pay their own way. What is here stated is not a theoretical guess; it was found out by the actual test of trial. Before me is the report of a school in which \$1,000 used in running the industrial departments aided effectually a larger number of students than the money divided among them could have kept at school. And the aid was not in the nature of a gift; it was for work done and fairly priced. Such aid builds up manhood within.

"In illustration: Mr. B. T. Washington (himself a colored man, taught at 'Hamp-ton,' and with the Armstrong spirit in him), principal of the State Normal School, Tuskegee, Ala. (the State appropriates \$3,000 per annum), says in his report for 1885: 'Able-bodied young men and women work out on an average \$3 per month on their board bills, leaving only \$5 to be paid in cash. Work is required of all for purposes of discipline and instruction, and of teaching the dignity of labor.'

"In such institutions the students are paid an average of ten cents an hour for their work, the amount being credited on their bills. In Shaw University, Raleigh, N. C., for example, during the school year, 1886-87, there were ninety boys in the carpentry department, each one being required to work forty hours per month; eighty young women were in the dressmaking department, and eighty-one worked one hour each day in the dining-hall and cook-room. During this year Shaw University used as 'student aid' for work done \$800. This institution, while among the best in book-learning, is a hive of industrious people. No man who knows the facts doubts that the industrial departments make education possible to great numbers, and in such way as to cultivate rather than destroy self-reliance.

"Students of negro education and of the questions that go with it will be glad to know what some of the veteran and wise teachers think about this whole matter of hand-training, carried on coincidentally with head and heart training. I introduce here quotations from personal and official statements made to me by some of the most experienced and successful workers in these schools. If anybody knows what is good for negro youth these men and women should know. They do know.

"President W. B. Patterson, of the State Normal University, formerly at Marion, now at Montgomery, Ala., says: 'Instead of losing, as some anticipated, the students have gained in the thoroughness of their literary work. The training of the eye and hand has developed their general intelligence, cultivated their power of observation, and given more precision to their work.'

"Principal Becker, of Benedict Institute (Baptist Home Mission), Columbia, S. C., writing of his industrial departments in their relation to intellectual drill and development, says in his report for 1885-86: 'Those who have had to do with teaching the colored people have found two great difficulties in the way, to wit, sluggish action of the mind and the ease with which they have been discouraged. The aid that has been afforded in quickening the mental energies, by the introduction of the industrial work, could not be believed by those who have not had to do with it as we have. We find the

grade of scholarship growing better in the case of all who have been engaged in the industrial departments. I explain the difference by the fact that they found work they could do, and so, getting the sense of mastery and real power to overcome obstacles, carried it into their literary work.

"Another value of this industrial work has been in the teaching of the economy of time, which lies at the foundation of all other economy. Some who laughed at those who took the work at the opening of the school and spent their odd hours in idleness saw these shoemakers and carpenters doing things utterly impossible to them at the close of the year, and done in time that they had utterly wasted. They also saw the workers able to pay their way for a month or more by the work they did, while they were compelled to go home, for I gave no aid to those who declined to enter the industrial department."

"The method is not alike in all the schools; Principal Becker made entering the industrial department voluntary, as he aided only those who worked—nearly all worked.

"In 1886-87 the industrial departments at Benedict were still more vigorously and successfully pushed. In March, 1887, Principal Becker wrote to me: 'The introduction of the industrial work has changed the whole fibre of our other work. * * * A student who has no interest in the industrial departments is certain to be of no account in any other.'

"President De Forest, Talladega College, Alabama (American Missionary Association), says: 'It is conceded that slavery disgraced and disabled labor, and that freedom was generally regarded as a boon of exemption from work and restraint. Upon his emancipation the negro did not at once perceive that self-control involved self-support, and that self-support involved work and economy. The danger of a little learning, never greater than when a people are emerging from ignorance, may be avoided by vigorous manual and moral training. Any education of the freedman which neglects either his physical or spiritual nature is utterly inadequate. The poverty, waste, and wretchedness so prevalent in a region where all the necessities of life are easily secured make a cogent reason for industrial training; while another and hardly less weighty one is found in the incidental effects of such education in reinforcing the will, in developing perseverance, and even in developing the conscience by making plainly apparent the results of good and bad workmanship.'

"President Braden, Central Tennessee College, Nashville (Freedmen's Aid Society), speaking of the young women of the industrial departments, says: 'I realize more the importance of this work as I learn how close is the connection between comfortable homes and virtuous lives. The young women are more independent, have power of greater usefulness, either as teachers, wives, or mothers.'

"Miss S. B. Packard, principal of Spelman Female Institute, Atlanta, Ga. (Woman's Baptist Home Mission), had in charge for the school year 1886-87, 640 girls and young women. Miss Packard says: 'Instead of losing in intellectual development there is a decided gain in thoroughness because of the industrial work. The training of eye and hand not only increases the power of observation and gives precision to their work, but prepares them for homes of their own.'

"President Price, one of the first men of the negro race in the country, Livingstone College, Salisbury, N. C. (African Methodist Episcopal Zion Church), says: 'I feel that industrial training is imperative at this stage of our development as a race.'

"Such statements by those who are actually in the work of 'uplifting the lately emancipated race,' and who best know the conditions of successful work, might be extended through whole pages of this paper. Christian schools that train heads, hearts, and hands can in the long run solve almost any problem for any race."

This Office sees no change in the character of the instruction given; it appears to be trade, apprentice work, as noticed in the preceding Report, at p. 790.

At Atlanta University 12 forges have been added to the equipment and mechanical drawing and both placed under the charge of a graduate of the School of Technology of Worcester, Mass. The students have fitted up the two rooms as a part of their training. Nearly 120 boys have had instruction in the shop for $1\frac{1}{2}$ hours. A printing press has been given and farm work, cooking, and sewing has been carried on as before.

At Clark University the "Ballard shop" has been completed. The building, costing \$5,500, is 40 by 100 and is built of brick. In the carriage shop wood and iron work, trimming, and painting have been extensively carried on, the net returns for work being for the year about \$2,000. From the work of the nine boys in the harness shop \$350 have been obtained. In the printing shop much job work has been done; in the carpentry shop many pieces of furniture have been made. In sewing and dressmaking 160 girls were taught and some of them fitted for an independent living. "All at Clark," says Agent Haywood, "are more than ever pronounced for industrial training, and the new building is a great gift to a good work."

At Fisk University 15 received instruction in cooking, 16 in nursing, 100 in sewing. It is expected to erect a brick building 40 by 80 next year for young men who desire to receive instruction in tool craft.

At Howard University carpentry is the most largely followed trade; printing, shoe-making, and tailoring are also taught, and sewing to girls.

In fact the industrial departments of these schools, most substantially aided by the Slater Fund, are rapidly preparing to turn out skilful mechanics, as they have been turning out teachers from their literary departments in the past. But in giving this industrial instruction it appears that an educative effect obtains, that the intelligence of the pupil is awakened. The principal of the Benedict Institute, an enthusiast on this subject, speaks with enthusiasm in regard to it: "Before the introduction of this industrial work I confess I had begun to be painfully conscious that there was nothing natural in the work in the classes, only in exceptional cases, but distressingly like perpetual galvanizing or magnetizing of a dead body. It was, apply the battery, apply the battery, until it was distressingly painful. The whole of that has been changed, and the energy of the best educational influences is everywhere stirring and animating all the classes. * * * To put the student down to accurate and thorough work was to utterly derange and discourage him. That facility of discouragement has disappeared from among us, and now, instead of deeming it wholly useless to put a hard task before the students, I defy any one to set them so hard a task within any reasonable hope of attainment that they will not only take hold of it, but rather enjoy it the more as its difficulties become apparent. The sense of personal power developed by this work is to me a wonderful and delightful revelation."

VI.—INDIAN SCHOOLS.

By a recent act Congress has made a radical change in the management of Indian schools supported in whole or in part by the Government. In the absence of a report from the Superintendent of Indian Schools¹, we copy the report of Indian Commissioner Oberly, himself formerly the superintendent of Indian schools. Our examination of the subject in our report of last year, based on the report of the superintendent, amounted practically to a statistical monograph, a study which there is no necessity to repeat now.

THE DUTIES OF THE SUPERINTENDENT OF INDIAN SCHOOLS.

Commissioner Oberly, speaking of the creation of an independent office of Indian schools, observes, and we quote him so fully because his opinion is of much weight by reason of his experience:

"Formerly all school employes, excepting the superintendents of the industrial training schools at Carlisle, Pa.; Lawrence, Kans.; Genoa, Nebr.; Salem (Chemawa), Oregon, and Chillicothe, Ind. T., were appointed by the Commissioner of Indian Affairs, upon nominations made either by Indian agents or by the superintendents of the industrial schools referred to above. But by the act making appropriations for the Indian service, approved June 29, 1888 (section 8), it is provided that the Superintendent of Indian Schools 'shall, subject to the approval of the Secretary of the Interior, employ and discharge superintendents, teachers, and other persons connected with schools wholly supported by the Government.'

"This and other additions that have been made by the current appropriation act to the duties of the Superintendent of Indian Schools has raised certain questions concerning the relations of that officer to this Bureau.

"Heretofore the Bureau of Indian Affairs has had, subject to the supervision of the Secretary of the Interior, authority to do the following things in reference to Indian school matters:

"(1) To disburse all gratuity appropriations made for Indian education and also all Indian treaty education funds. Under this authority the Bureau has purchased clothing and subsistence and all other articles necessary in the management of the schools; has contracted with private institutions for the education of Indian children therein at Government expense; has determined the number of and the compensation that should attach to positions in the schools; has determined questions relating to the establishment of new schools, and the preparation of plans of buildings therefor; has paid all school salaries, and has settled all accounts of officers disbursing school moneys.

"(2) To employ and discharge superintendents and teachers, and any other person connected with the schools, except superintendents of the Indian training schools.

"(3) To make rules and regulations for conducting the schools.

"In short, until July 1, 1888, the Indian school system was, in fact, entirely under the supervision and management of the Bureau of Indian Affairs, and in order to show in what respects this supervision and management has been modified or annulled by the act of June 29, 1888, making appropriations for the Indian service, it will be necessary to give a short review of the legislation regarding the office of Superintendent of Indian Schools prior to that date.

"By the Indian appropriation act of May 17, 1882, the President was authorized to appoint an officer, to be known as the Inspector of Indian Schools, and upon this officer the following duties were imposed:

"(1) To inspect all Indian schools.

"(2) To report a plan for carrying into effect treaty stipulations for the education of Indians, 'with careful estimates of the cost thereof.'

"(3) To report 'a plan and estimates for educating all Indian youth for whom no such provision now exists, and estimates of what sums can be saved from existing expenditures for Indian support by the adoption of such a plan.'

"The appropriation act for the following fiscal year of 1883-84 changed the title of the new office to that of Superintendent of Indian Schools, which title has been continued in all appropriation bills enacted since that time; but until the passage of the act of June 29, 1888, no further reference was made in any law to the duties of the position. And it will be observed that duties 2 and 3, as declared by the act of 1882, were not what might be called continuing duties; they were terminated upon the making of the reports required. So that, after these duties had been done, the only duty of the Superintendent was, until July 1, 1888, the inspection of schools. But his duties were added

¹ Under date of January 16, 1889, the Superintendent, Mr. Albrow, issued a brief report, which contains no statistics, however.

to by section 8 of the appropriation act, which went into effect on that day, and from that date it became his duty—

“(1) To visit all schools where Indian children are taught under authority of the Government, and to make to the Secretary of the Interior certain reports in reference to such schools.

“(2) To ‘employ and discharge superintendents, teachers, and any other persons connected with schools wholly supported by the Government.’

“(3) To make rules and regulations for the conduct of such schools as are wholly supported by the Government.

“By this enlargement of the duties of the Superintendent of Indian Schools, Congress took from the Commissioner of Indian Affairs the authority to appoint and discharge superintendents, teachers, and other school employes and to make rules and regulations for conducting the schools, but left with the officer the duty of disbursing all funds for Indian education—the duty of making all purchases for the schools and all contracts for educating Indian children, or building school-houses, paying school salaries, and settling the accounts of all officers who disburse money for school purposes.

“At first glance this law seems to be comprehensive and far-reaching, but, in my opinion, its scope is restricted, and it does not, in fact, furnish adequate means for the carrying out of its apparent purpose. As stated, the act of June 29 last changed the law then in force in two particulars only—first in the authority to make appointments and dismissals; and, second, in the authority to make school rules and regulations; and it left undisturbed all the official machinery of the Bureau of Indian Affairs for disbursing school moneys, making school contracts, paying school salaries, etc. The responsibility for all such transactions remains with the Commissioner of Indian Affairs; and, necessarily, all the business records pertaining thereto must be embodied in the records of the Indian Office. With all this business, as it occurs, and with the methods of conducting it according to law or precedents having the force of law, the Superintendent of Indian Schools should be thoroughly familiar, so that he can intelligently and efficiently discharge his duties, which, limited as they are, imply and require knowledge of the details of the entire Indian school service; and this knowledge can be obtained in no other way than by visiting the schools, and by supervising, under the Bureau of Indian Affairs, all the matters of Indian education that are considered and determined by that Bureau. In this way the Superintendent might have his restricted duties so enlarged that they would cover the entire subject of Indian education, and his limited official power so increased that it could command all the official machinery of the Indian Bureau in the execution of his decisions upon school matters.

“Upon these considerations I have reached the conclusion that the most natural, economical, and effective administration of Indian school affairs will be secured by enlarging the prerogatives of the Superintendent—

“(1) By placing under his immediate supervision all matters connected with all branches of Indian education, instead of restricting him to two lines of work in connection with but one class of schools; and

“(2) By providing that he shall perform the official functions necessary in the discharge of such enlarged duties through the Bureau of Indian Affairs, under which arrangement the Commissioner of Indian Affairs may place at the disposal of the Superintendent the entire official machinery of the Bureau, by the use of which nearly all the business in relation to Indian schools is, and must be, transacted.

“By this plan the Commissioner and Superintendent would exercise concurrent jurisdiction, so to speak, in Indian school affairs. The Superintendent would practically dominate in all school operations, while the Commissioner would continue to perform, without the embarrassment that would result from divided authority, the duties in relation to Indian educational matters that have been devolved upon him by law and by the Indian treaties.

“I therefore recommend that the above suggestions be adopted, and that rules be made for the purpose of carrying them into effect.”

THE USE OF ENGLISH COMPULSORY.

The other important event in the administration of the Government schools for the education of the Indian is the requirement that the English language be used in them.

The action of the Bureau of Indian Affairs in this matter, it is well known, created considerable opposition on the part of several religious denominations, their opposition being “based upon the assumption,” says the Commissioner, “that it was the intention to forbid the reading of the Bible in the vernacular.” To correct this false impression the Commissioner issued a pamphlet; “but in view,” he says in the report we are using, “of the widespread and apparently deep-seated misunderstanding in regard to the bearing of these orders upon the use of the Bible published in Indian vernaculars, it may

be well to state that it is not the intention of the Indian Bureau to prohibit the reading of the Bible by any Indian in any language, or by anybody to any Indian in any language, or in any Indian vernacular anywhere at any time."

The Commissioner observes, under the title of

THE PLATFORM OF THE MOHONK CONFERENCE:

"Nothing, it is maintained, should be done to impair or weaken any of the agencies at present engaged in the work of Indian education. It is therefore concluded that the contract system ought to be continued until the Government is prepared with adequate buildings and competent teachers to assume the entire work of secular education; but the duty of the Government to undertake the task of furnishing primary and secular education for all Indian children of school age on the reservations under Federal control must be constantly insisted upon. In the language of the platform of the Lake Mohonk Conference, at its sixth annual session, held last October, the Government 'has no right to thrust this burden [of Indian education] upon the pioneer population in the midst of which the Indians happen to be located. It has no right to leave this burden to be carried by the churches and private philanthropic societies which have taken it up only because the necessity was great and the neglect absolute. The cost of education is immeasurably less than the cost of war; the cost of educating the Indian for self-support is less than one-tenth the cost of keeping him in pauperism.'

"With that conference this office is also in full agreement upon the following propositions:

"(1) That Indian education should be compulsory; but on those principles of compulsion which are recognized as legitimate in the free commonwealths of the world, which principles, while they would require the Indian child to receive such education as would fit him for civilized life and self-support therein, would leave with his parents the liberty to choose between the Government and the private school, so long as the private school furnished the elements required by civilized life and conformed to a uniform standard prescribed by the Government and maintained in its own schools.

"(2) That a uniform standard of qualifications should be required of all teachers receiving appointments, and should be enforced by rigid and impartial examinations.

"(3) That the official tenure of the teacher should be permanent, and removals should be made only for inefficiency, incompetency, or other unfitness.

"(4) That the whole educational service should, in the interest of just administration and efficient work, be exempt from those changes and that instability of tenure which appertain to partisan appointments."

SCHOOL BUILDINGS.

The construction put by the Treasury Department upon the clause in the Congressional appropriation bill restricting the price of a school building to \$10,000 has and is working disadvantage to Indian education. The Treasury Department has held that ten thousand dollars is the maximum limit for building and furnishing, and further that no appropriation for building in general can be used to construct an addition to a building which has cost for building and furnishing ten thousand dollars. The Commissioner gives an instance of the working of that Congressional limitation and its construction, as follows:

"It is true that \$10,000 is sufficient to erect suitable school buildings in some localities, but in most localities that amount is entirely inadequate; and this limitation, thus construed, has prevented this Bureau from furnishing suitable and adequate school-building accommodations upon many reservations where they are much needed. For instance, the Ute Indians, on the Uintah Reservation, Utah, have 250 children of school age, and until recently they have sullenly refused to have their children educated. Every effort to induce them to send their children to the school at Grand Junction, Colo., which was established in part for their benefit, has been unsuccessful, and at this time not one Ute child is in attendance thereat. 'We will not,' they said, 'send any of our children away to the Grand Junction or any other school, but we will send all our children to school if a good school is established at our agency.' To test their sincerity, a competent teacher and some school supplies and furnishings were sent to the agency, where there is a school building, but a building that is in every respect unsuited for its purpose. This building can not properly accommodate even 25 pupils; but 36 have been crowded into it. Observing this desire for educational advantages, which patience and hard work on the part of the agent and school superintendent had succeeded in awakening in these non-progressive Indians, and being anxious to give it fair opportunity and scope, plans and specifications were prepared for the erection of a boarding-school building large enough to accommodate 75 children. The plans were for a plain build-

ing, to be erected with all possible economy consistent with stability and comfort. Bids were advertised for, according to law, and the lowest received was \$13,000 in excess of the building limitation of \$10,000. This instance is cited to show how difficult it is, while acting under the restrictions of such a rigid policy of economy, to do prompt and effective work in the pending attempt to educate the rising generation of Indians."

STATISTICS.

"On June 30, 1888, the end of the last fiscal year, the Government was supporting, in whole or in part, 233 Indian schools, of which 126 were boarding and 107 were day schools."

"On June 30, 1887, the end of the preceding fiscal year, there were 227 such schools—117 boarding and 110 day schools."

"It thus appears that during the fiscal year there was an increase of 9 in the number of boarding and a decrease of 3 in the number of day schools, the net increase in the whole number of schools being 6."

"Of the 126 boarding schools, 74 were under direct control of this Bureau, 3 were schools at which pupils had been placed under special appropriations made by Congress, and 49 were being conducted under contract with the Government. Of the day schools, 85 were under direct control of the Bureau and 22 were contract schools."

SCHOOL POPULATION, ATTENDANCE, ETC.

"The schools above referred to were supplied from a school population of, approximately, 40,000 children between six and sixteen years of age."

"The attendance at these schools, the number of pupils whom the school buildings could accommodate, and the cost to the Government of maintaining the schools during the fiscal year 1887-88, are shown in the following table:

TABLE 104.—*Showing Number of Schools, School-house Capacity, Enrolment, Average Attendance, Number of Employés, and Cost during the Fiscal Year ended June 30, 1888.*

"The three schools 'specially appropriated for,' mentioned in Table 105, are not Government schools. They are private institutions, in which Indian children are placed under appropriations annually made by Congress for the education in such schools of a specified number of pupils at a certain rate per capita per annum.

"The enrolment and average attendance at Government and contract schools (including the three schools specially appropriated for) during the fiscal years 1886-'87 and 1887-'88, respectively, and the increase in enrolment and in attendance during 1888, as compared with 1887, was as follows:

TABLE 106.—Showing Increase of School Enrolment and Average Attendance during the Fiscal Year 1887-'88 over the Fiscal Year 1886-'87.

Kind of School.	Enrolled.		Increase.	Average Attendance.		Increase.

"In addition to the regular employés above enumerated a large number of persons are irregularly employed in connection with the schools. The great majority of these irregular employés are Indian pupils engaged in learning trades, to each of whom a few cents a day are paid. These payments are justified by the fact that the pupils work more willingly and industriously and learn more rapidly under the incentive of small wages than they would if they were not thus recompensed for their labor; and, moreover, they thus learn the value of small earnings and small savings."

CHAPTER XVIII.

EDUCATIONAL PERIODICALS.

The following list of educational periodicals represents such as are on 'file in the library of the Office, and such as are found useful in making up the annual report. Some in the list, no doubt, have suspended publication. There is no way at the disposal of the Office of finding out when many of these periodicals began or when they ceased publication.

The table is intended to give a brief description of these publications.

CHAPTER XIX.

EDUCATION IN FOREIGN COUNTRIES.

STATISTICS OF ELEMENTARY EDUCATION IN FOREIGN COUNTRIES.

[Table 110.]

Table 110 presents the principal statistics relating to elementary education in foreign countries whose reports have been received at this Office. As few countries report their school population, the total populations have been given in Column 2, Part I, of the table, as a basis for comparing school enrolment.

Where the latest census antedates by several years the year of the school report, estimates of the total population for a nearer date have been employed when attainable. The fact is indicated by a foot-note. Such estimates have been taken from the educational reports, or from the Statesman's Year-Book for 1887.

The school ages reported from 35 countries range from 5 to 21 years. From an inspection of Column 3, Part II, it will be seen that seven countries report a longer period than 9 years, while nine report a shorter period than 8 years. The average period is 8.2 years. The statistics of school population and enrolment in Hungary include the youth 6 to 15 years of age, which are accordingly given as the limits of the school age. In fact, attendance upon elementary schools in Hungary is obligatory from 6 to 12 years of age, inclusive, and upon the "review" or "continuation" schools from 12 to 15 years. The latter may be day, evening, or Sabbath schools. In them the branches pursued in the ordinary elementary schools are reviewed, and somewhat extended. The school age in Bavaria includes also 3 years in the review schools.

In England and Scotland it is customary to include only six-sevenths of the population in estimating the number of children for whom provision should be made in State-aided elementary schools. As the omission of one-seventh of the population in these estimates is misleading when the statistics are tabulated with those of other countries, the numbers showing the entire child population as given in the official reports from those countries are used in this table.

It will be observed that the school population of England and Wales is given for the years 5 to 14, and also 3 to 14; the former is the obligatory school period. Children are, however, admitted at 3 years of age, and the enrolment includes pupils as young as that, together with a small number above 14 years of age.

In the case of Finland the enrolment includes pupils in infant schools.

The ratios of school enrolment to total population, and to school population when reported, are shown in Table 111.

Care has been taken to confine the table to the statistics of elementary schools; *i. e.*, schools below the high school grade, which is substantially the same for all countries. In a very few instances the distinction is not clearly preserved in the original reports, and the totals of enrolment and teachers possibly include high schools. It is certain, however, that in these cases, which are few, the totals are not greatly affected thereby.

A glance at the columns setting forth the number of schools and the school enrolment will show that the word "school," or its foreign equivalent, has various applications. It sometimes signifies the scholars in charge of one teacher, and sometimes a collection of such bodies forming a series of grades in one building.

In the case of Württemberg, the number of teachers' positions is given in Column 12, the number of teachers employed not being reported. Pupil teachers are a feature of the school systems of England and Wales, Scotland, New South Wales, and Japan, and are included in the totals of teachers for the three former countries. The teaching force reported for Ireland includes 665 work mistresses and temporary assistants.

The expenditures reported include as a rule teachers' salaries and cost of supervision and administration.

For Saxony the amount includes expenditures for 1,892 Fortbildungsschulen and two schools for deaf-mutes; for England and Wales and Scotland the cost of night schools is included; and for Ireland and Jamaica the amount is the reported income of the schools, which is presumably equivalent to the expenditure.

In the following countries represented in the table, the elementary schools are free schools: France, Italy, Switzerland, Algeria, British Columbia, Manitoba, New Brunswick, Nova Scotia, Ontario, Prince Edward Island, Costa Rica, Guatemala, Argentine Republic, Chili, Victoria, Queensland, and New Zealand. In these the cost of elementary education is defrayed by State and local funds. The Prussian constitution of 1850 declared that instruction should be gratuitous in the elementary schools, but the provision has not been carried into effect for want of means. For the accomplishment of this purpose a bill was introduced into the Landtag in January, 1888, calling for an appropriation equivalent to five million dollars. The bill passed and was one of the last acts signed by the Emperor Frederick. After October 1, 1888, the collection of fees will cease and the elementary schools will be free.

In Venezuela the law provides for free schools, but this provision does not appear to have been carried into effect. In the remaining countries a portion of the cost is met by tuition fees.

In addition to the tabulated statistics of elementary instruction in France the official report gives a total of 6,090 maternal schools, enrolling 761,692 pupils and employing 9,219 teachers. The number of pupils in superior primary schools or complementary courses was 38,776 (viz, 27,295 boys and 11,481 girls).

In Table 110, Part I, Mons. Berthelot is given as the minister of public instruction in France. This gentleman was succeeded by Mons. Spuller, December 12, 1887, who gave way January 1, 1888, to Mons. Léopold Faye. The term of service of the last-named terminated April 3, at which date Mons. Edouard Lockroy was appointed.

PUBLIC INSTRUCTION IN FRANCE.

REPORT TO THE DEPARTMENT OF STATE BY THE HON. J. L. BATHBONE, CONSUL-GENERAL.

I.

At the close of the Revolution the state of public instruction in France was extremely bad. The law of April 30, 1803, revived it somewhat, and the establishment of the Imperial University in 1808 brought about complete re-animation.

The university formed a corps, having complete charge of education throughout the Empire; at the head was a grand master, assisted by a council, all appointed by the Emperor.

The Empire was divided into as many academies as there were imperial courts (27). Each academy was governed by the rector, and controlled absolutely within its jurisdiction the establishment and conduct of all degrees of instruction.

A director and an academic council were associated with the rector. In addition there were a number of inspectors-general to watch over the condition of education throughout the Empire, to verify the capability of the teachers, and to report the progress of the pupils. But with all this, primary education was neglected and schools were established only in the communes sufficiently rich to support them.

Since the establishment of the university changes have been made. There is no longer a grand master, but a "Minister of Public Instruction," whose functions are less autocratic. Under the former régime no one could open a school without the permission of the grand master. By the laws of March 15, 1850, and July 12, 1815, any Frenchman of proper age and conforming to the laws may found a school of any grade.

MINISTER OF PUBLIC INSTRUCTION.

But the minister's powers are yet very considerable. It is upon his proposition that the President of the Republic names and revokes the inspector-general, the rectors, the professors of the faculties, and the administrators of public libraries. The minister directly names and revokes the professors of secondary instruction, the inspectors of primary instruction, employes of public libraries, and in general all functionaries of public instruction.

FUNCTIONS OF THE COUNCIL.

The council is composed of the minister of public instruction (president of the council), three members of the council of state, five members of the institute, members from the army, the navy, the Catholic Church, the Protestant Church, and nine lay members; in all, thirty-nine (39) members.

The council prescribes the course of instruction in all public schools, establishes new lycées and communal colleges, and determines what assistance shall be given to private schools. It determines further what books shall be used and what proscribed as being contrary to the constitution, law, and morality, and grants licenses to foreigners to found schools in France; finally, it has judiciary functions, and pronounces in the last resort in cases tending to exclude teachers from their profession.

THE INSPECTORS-GENERAL.

The inspectors are eighteen (18) in number, and their duty is to collect information regarding all questions concerning public instruction in France, and report the same to the minister. Twelve (12) of them, together with certain professors, form a consultation council at which the minister presides.

THE ACADEMIES.

Below the central body come the academies. The rectors superintend the higher and secondary schools, oversee the free schools, and control the primary schools. Each convokes the faculties of the various schools in his department to devise courses of study and transmits these courses to the minister, together with his views upon them. Associated with him are an inspector and an academic council. These academies are not, as the word would imply with us, institutions of learning, but the representatives of the Government in the district.

THE HIGHER NORMAL SCHOOL.

To complete the educational framework, normal schools were established to train teachers for the primary schools, and a higher normal school to prepare teachers for the lycées, communal colleges, and all schools of instruction above the primary grade. The pupils are at the charge of the state. The number of pupils to be admitted each year is determined by the minister, according to the needs of education.

II.

Public instruction is divided into three grades, primary, secondary, and higher.

Primary Instruction.—Primary instruction is obligatory, and includes religious instruction, reading, writing, arithmetic, geography, history of finance; and for girls, needle-work. Except in small places, the children of the Protestant and Catholic faiths have separate schools, and the sexes are also separated.

Attendance is compulsory; tuition is free to children whose parents are unable to pay. Every commune must support at least one primary school, or a free school affording the same opportunities, but in cases of thinly populated communes they may, by the consent of the minister, combine to support a school. Budgetary aid is rendered only to communes which are unable to wholly sustain the expenses of their schools.

Secondary Instruction.—The schools of this grade correspond very nearly to our high schools. Instruction is given in languages, ancient and modern, mathematics, the elements of natural sciences, history, and literature.

Belonging to this class are all the lycées, communal colleges, and nearly all the institutions known as free schools, *i. e.*, giving free tuition, although not belonging to the state.

By a law passed in 1865, special secondary schools were established where the dead languages are not taught, and special attention is given to fitting pupils for business.

Higher Instruction.—Higher instruction is given by what is known in France as the faculties, supplemented by a number of preparatory professional schools. The faculties are those of law, medicine, theology, science, and literature. The preparatory schools are a higher school of pharmacy, schools of medicine, chemistry, and literature.

III.—SPECIAL SCHOOLS.

Besides the public schools system there exists to-day in France quite a number of schools for instruction in special branches of knowledge; some of these, like the School of Telegraphy, are exclusively for Government employes, while others, like the Free School of Political Science, are open to the world.

The Schools of Telegraphy.—Intended to fit employes of the post-office and telegraph system.

The Military School of St. Cyr.—Corresponds to our school at West Point. This school was established at Fontainebleau by Napoleon I in 1802, but was soon removed to its present site.

The Prytanee.—A school for the education of the children of army officers.

Schools of Manual Apprenticeship.—These are supplementary to the primary schools and fit the pupils for the farm and the workshop. The instruction is both theoretical and practical. To gain admission to any of the above special schools the applicant must either be born French or naturalized.

Higher Schools of Commercial Studies.—These are devoted exclusively to higher commercial studies, and designed to fit students to be merchants, bankers, administrators, and directors of manufacturing and commercial companies, etc. Foreigners are admitted.

National School of the Industrial Arts at Bourlaix.—The course at this school is practical and theoretical study of the local manufacture of cloth, which is very celebrated. Foreigners are admitted by means of a letter from their ambassador or consul.

The Polytechnic School at Paris.—To fit for military, naval, and hydrographic engineers, for engineers of the military bridge corps, superintendents of state manufactories, telegraph lines, etc., and all other careers demanding extended study in mathematics, physics, and chemistry. Foreigners are not admitted.

High School of Mines at Paris.—Extended study of chemistry, physics, electricity, mining engineering, etc. Foreigners are admitted free, but no diplomas are granted to them; only certificates of study.

School of Master Workmen of Mines at Calais.—To fit foremen of miners, managers of mines, etc. To be admitted to this school the applicant must have worked in the mines at least eighteen months. The course of study is both theoretical and practical, six months of each year being spent in the school and six in the mines. The course is for three years. Foreigners are admitted.

Schools of Roads and Bridges.—To form a corps to construct and keep in repair the military and strategic roads and bridges. Foreigners are admitted after a great deal of formality.

Schools of the Fine Arts at Paris, Bourges, Dyon, and Lyons.—Instruction is given in drawing, painting, sculpture, engraving on wood, copper, and steel. Foreigners are admitted to all these schools.

National School of Decorative Art at Paris.—This school is open to foreigners on application to the director through the aid of their ambassador and consul-general and the minister of fine arts.

Agricultural Schools.—At the head of these is the Institute of Agronomy, intended to fit pupils to be teachers in the national schools of agriculture, to be scientific proprietors or managers of farms, and to be capable administrators of public duties where agricultural and vinicultural interests are involved.

National Schools of Agriculture.—At these schools practical and theoretical instruction is given in agriculture, viniculture, irrigation, dairying, etc., and at Rambouillet is a shepherd school.

School of Horticulture at Versailles.—Gardeners are taught their duties at this school, the course being both theoretical and practical.

School of Forestry at Nancy.—To this school foreigners are admitted through their ambassador. The majority of the pupils are those who expect to enter the government employ as keepers of the national forests.

Veterinary Schools.—There are three of these, at Lyons, Toulouse, and Alfort.

Schools of Arts and Trades.—The central school at Paris is known as the School of Arts and Manufactures. It graduates engineers for all branches of industry and for public works which do not pertain directly. Foreigners are admitted on the same terms as Frenchmen.

The other schools are situated at Aix, Angers, and Châlons. Candidates for admission must be French. These are regarded as by far the most important of all the industrial schools.

They are intended to turn out workmen thoroughly skilled in all mechanical employments. These schools accommodate three hundred pupils each, who must be French.

Schools of Watch and Clock Making.—There are two. Foreigners are excluded.

There are several schools of lace-making and five schools of weaving. In the latter the course includes the theory and practice of weaving, designing patterns, and weaving them, the study of dyes and their application to the cloths. The school at Lyons has a special course on the manufacture and dyeing of silk stuffs. The others are situated at Nîmes, Reims, Amiens, and St. Etienne.

Free School of Political Science.—This school closes the list of special schools. Instruction is given in diplomacy, administrative law, finance, constitutional law and history, political economy, training and knowledge required by government officials in France and by consuls and consular agents, and, in fact, in all branches of government.

The budget¹ of the minister of public instruction shows the following figures for the year 1879 to 1886:

Years.	Higher Normal Schools.	Higher Communal Schools.	Lycées and Communal Colleges.	Extraordinary Expenses of Lycées.	Primary Institutions.	Total Budget.
	<i>Francs.</i> ²	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>
1879	401,000	300,000	5,625,000	1,500,000	23,350,000	59,725,000
1880	450,000	300,000	6,110,000	6,500,000	21,014,000	80,155,000
1881	479,000	300,000	8,470,000	6,500,000	32,685,000	83,229,000
1882	485,000	300,000	9,738,000	9,836,000	59,484,000	129,240,000
1883	500,000	300,000	11,274,000	9,850,000	77,034,000	145,721,000
1884	500,000	300,000	12,640,000	12,764,000	75,076,000	166,736,000
1885	500,000	296,000	10,739,000	11,937,000	61,621,000	168,408,000
1886	500,000	326,000	10,939,000	11,876,000	62,368,000	134,919,000

Besides, the primary schools receive annually about twenty million francs from the budget of extraordinary resources. Many of the special schools are not under the ministry of public instruction and so figure in other schools. The ministry of the interior's budget includes the following schools:

Years.	School of Roads and Bridges.	School of Mines, Paris.	Other Schools of Mines.	Totals.
	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>
1879	378,000	234,000	64,000	726,000
1880	360,000	235,000	65,000	710,000
1881	357,000	299,000	61,000	717,000
1882	380,000	305,000	63,000	748,000
1883	401,000	315,000	70,000	786,000
1884	400,000	328,000	73,000	801,000
1885	428,000	329,000	76,000	833,000

Under the ministry of agriculture are:

Years.	Veterinary School.	National Institute of Agronomy.	Agricultural Schools.	Practical Farm Schools.	Horticultural Schools.	Totals.
	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>	<i>Francs.</i>
1879	916,000	241,000	730,000	468,000	90,000	2,445,000
1880	1,127,000	253,000	752,000	514,000	101,000	2,747,000
1881	1,112,000	258,000	794,000	488,000	102,000	2,755,000
1882	1,155,000	271,000	824,000	516,000	103,000	2,869,000
1883	1,136,000	313,000	816,000	590,000	103,000	2,958,000
1884	1,167,000	278,000	828,000	649,000	94,000	2,954,000
1885	1,145,000	277,000	806,000	649,000	91,000	2,968,000

¹ The appropriations from the public treasury are supplemented by communal taxes.

² The equivalent of a franc is 19.3 cents.

GREAT BRITAIN.

REPORT OF THE SCIENCE AND ART DEPARTMENT.

The following information is derived from the thirty-fifth report of the science and art department, whose operations embrace the United Kingdom of Great Britain and Ireland.

The department fosters instruction in science and art by grants to elementary schools and to training colleges upon the results of examinations in the subjects specified, by grants for buildings and apparatus for science schools, and by provision for local exhibitions and scholarships.

The department also has charge of special schools of science and art and museums of science and art.

SCIENCE DIVISION.

Elementary Science.—In 1887 the department examined 1,684 elementary schools in which science instruction was given according to the requirements. These schools were located as follows: In England and Wales, 1,223; in Scotland, 227; in Ireland, 234. The number of pupils in them receiving science instruction was 103,088, and the number who came up for examination was 62,275, which, with 5,345 self-taught students, made a total of 67,620 examined. Of this number 51,248 were successful in passing in one or more subjects.

Advanced Scientific Instruction.—The total number of students under instruction in the various divisions of the Normal School of Science and Royal School of Mines was 267. As in former years, summer courses for country teachers, which last about three weeks, and are a most important part of the work of the school, were given in chemistry, light, botany, machine construction and drawing, and agriculture and agricultural chemistry. These courses, which consisted of lectures and laboratory practice specially adapted to the particular class of students, were attended by 182 teachers.

Courses of lectures in biology, chemistry, and mechanics were also given to working-men. The number of tickets sold at sixpence each being, for the three courses, 295, 458, and 357, respectively.

The number of students attending the Royal College of Science, Dublin, was eighty. A course of fifteen voluntary lectures on elementary chemistry given during the first half of the year was attended by twenty-seven students and a similar course of seventeen lectures on mechanics was attended by eight students.

The growing appreciation of science instruction in the Kingdom is indicated by the steady increase in the number of students pursuing the same and in the marked improvement in results. As compared with 1877 the number of students receiving instruction in elementary science in 1887 showed an increase of 84 per cent.; the number presenting themselves for examination, increase of 96 per cent.; and the number passing, increase of 97½ per cent.

ART DIVISION.

Drawing in Elementary Schools.—In 1887 drawing was taught in 3,979 elementary schools; of these 516 were situated in Scotland and under the inspection of the Scotch education department, by whom the grants were paid. The number of pupils and pupil teachers examined for results in drawing in these schools was 684,306.

Examinations were also held in fifty-one training colleges in the five subjects of the

drawing certificate. These subjects, with the number of students examined and passing in each, were as follows:

Subjects.	Number of Students Examined.	Number Passing.
Free-hand drawing.....	1,700	775
Geometrical drawing.....	1,624	959
Model drawing.....	1,871	895
Perspective.....	1,758	1,084
Blackboard drawing.....	1,643	1,008

Art Schools and Art Classes.—The total number of students receiving instruction in schools of art and art classes aided by the department was 74,701, in addition to which 122 schools unaided by the department were examined. In the National Art Training School, South Kensington, 590 students were under instruction. The system of having short courses of instruction at South Kensington for teachers of provincial schools during the summer vacations, which had been found so advantageous for science teachers, was extended to those in art in the summer of 1887. The experiment was successful in every way.

Expenditure of Department.—The expenditure of the department for the financial year 1887-88 amounted to \$2,093,771, which was apportioned as follows: Expenses of administration, including central staff office, \$137,109; direct payments, prizes, etc., to encourage instruction in science, \$498,269; direct payments, prizes, etc., to encourage instruction in art, \$473,077; services common to both science and art instruction, \$283,994; institutions supported or aided by the state through the department of science and art, \$275,611, and the South Kensington and Bethnal Green Museums, including the expenses of circulation of science and art objects to country institutions, \$425,712.

OPERATIONS OF THE TECHNICAL EDUCATION ACT, SCOTLAND.

With respect to the act of 1887 providing for technical education in Scotland the committee of council on education say:

"The technical schools act (Scotland) has opened to school boards a new field of operations in regard to a branch of education to which public attention has of late been very closely directed, and which greatly affects the future of secondary schools. In view of the fact that the act came into force after the recent elections of school boards, we thought it right to issue a circular letter on the subject in anticipation of those elections, pointing out the character of the operations possible, and inviting the attention of the constituencies to the new powers which would be vested in their representatives, and to the various systems of technical education already established elsewhere.

"It is a matter of regret that the subject does not appear to have been very prominently brought forward during the elections, and that school boards, perhaps, as a consequence, show some hesitation in starting upon any new operations. We have now received three hundred and eighty-one replies to our inquiry which was addressed to nine hundred and eighty-one school boards, and only a very small number of these indicate any intention of taking action under the act. We are not disposed to infer from this that the subject is disregarded, and, on the contrary, we believe that it is attracting that attention which its importance and urgency demand, and that discussion is now doing much to define the proper aims and methods of such instruction. School boards naturally feel hesitation about launching upon new expenditure, and are, perhaps, disposed to watch the results of experiments elsewhere. We feel confident that they will be ready to follow the example of those who are bold enough to enter upon the work, and, in once more drawing attention to the vital importance of the question, we can assure the local authorities of our zealous co-operation in any efforts which they may make. We have already referred to certain branches of technical education which come within the sphere of the elementary schools, particularly to drawing, agriculture, and the industrial instruction of girls; and we are ready to consider any proposals by which these may be developed, and by which they may be carried on in secondary and evening schools. Technical instruction is already very considerably developed in several of the higher schools."

"In a private school of well-established position we have found a commercial department very thoroughly developed, and we shall watch with interest this experiment of giving instruction in the details of office work. In any project for the advancement of

technical education we would again impress upon school boards the importance of enlisting the co-operation and sympathy of those who represent the manufacturing and industrial interests of each district; and we would, in reference to the difficulty of isolated action which has been felt by some boards, point out the powers of combination between different boards which are given by the act. We are convinced that it is only by such co-operation and combination that a system of education which may undoubtedly require considerable expenditure, but which justifies that expenditure by the important influence it may have upon national prosperity, can be successfully established."

INSPECTION OF SECONDARY SCHOOLS IN SCOTLAND.

In 1885-86 the Scotch education department undertook the inspection of secondary schools.

Their report of this work for the current year (*i. e.*, 1887-88) contains many observations of general interest. As was expected the immediate result of the inspection was the exposure of defects in the schools. With respect to this particular the committee say:

"We found the schools in many cases working under adverse conditions, with insufficient resources and staff, and with a curriculum inadequate to modern demands. We found no common standard, and a very wide divergence between the range and achievement of schools nominally of the same class. There was much earnestness shown by the general body of the teaching staff, and, generally, there was a desire on the part of managers to increase the efficiency of the school under their charge, but there seemed to be considerable doubt and difference of opinion as to the proper aims and organization of a secondary school."

The beneficial results of the inspection are already noticeable. "The number of schools under inspection has increased from thirty-eight to forty-seven, twenty-two being higher class public schools, seventeen endowed schools, and eight schools under voluntary managers who have invited the inspection of the department.

* * * "In one or two cases renewed inspection has shown the adverse conditions to be almost insuperable, and has led managers seriously to consider the organization of the school on a new basis. In other cases a school is found to fail from causes which are evidently accidental and temporary. But as a rule the inspection has given evidence of renewed activity of a curriculum developing so as to meet modern requirements and of a more defined aim and improved organization. Special and increased attention is evidently given to the instruction in science, although in some cases the inspectors have found that it was more developed on what may be called the bookish than the practical side. Modern languages are taught in some cases with very considerable success, but a difficulty evidently arises which will occur to most of those interested in these languages as a branch of education, as to the different aims for which they may be studied—for the sake of the training of the mental faculties by careful grammatical accuracy, on the one hand, and for the sake of developing the imitative and conversational faculty, on the ground of its practical value, on the other. The reconciliation, as far as possible, of these two aims is a question which most urgently demands the attention of those who are best qualified to guide public opinion on the subject. In English we have found evidence of much sound work, although there appears to be some disposition, which we regret, to lay aside the study of history and geography in the more advanced classes, where it is especially valuable in training the judgment and widening the interests of the scholars, and to confine the instruction in these subjects to the elementary facts, learned by rote in the earlier classes.

"In what are commonly called the university subjects, Latin, Greek, and mathematics, the instruction is evidently, on the whole, sound and thorough, and in the last-named the Scotch higher schools are remarkably well advanced.

* * * "In connection with the inspection of higher schools the department has this year carried out the plan of a leaving-certificate examination. This was undertaken after careful consultation with the universities and with the authorities of secondary or higher class schools.

"Various professional bodies have announced their readiness to accept the certificate granted by the department, in lieu of the preliminary examination required from those entering upon a course of professional study. The examination will thus contribute materially to concentration of work in the secondary schools, where much inconvenience has been caused by the necessity of preparing pupils for various examinations of much the same standard, but based, in each case, upon different prescribed books. The certificates have been issued of three grades, honors, first grade, and second grade.

"The total number of candidates for the same was 972, in six subjects, and out of a possible number of 2,925 certificates, 2,334 were issued in the various grades."

EDUCATION IN SWITZERLAND.

REPORT TO THE DEPARTMENT OF STATE BY THE HON. BOYD WINCHESTER, MINISTER
RESIDENT AND CONSUL-GENERAL.

Since the day of Pestalozzi the science of pedagogy has received much attention, and to-day enjoys a high rank in Switzerland. A Switzer will tell you that no boy, no girl exists in the Confederation, save idiots and those under school age, who cannot read and write. The exceptions to this rule are not sufficient to constitute an illiterate class. They have laid broad and deep the foundations of an admirable system of public instruction. The law declares that the happiness of the people is to be found in good morals and good instruction, and that in a free country every citizen should have placed in his reach an education fitting him for his rights and his duties. The primary business of the state in Switzerland may be said to be keeping school. A school is one of the first things present to the eyes of a Swiss child and one of the last things present to the mind of a Swiss man. It comes to him in his cradle and attends him to his grave. On coming to a certain age the right to stay at home and play ceases. He is a member of a commune, and the commune will not suffer him to live and grow up in ignorance. The school seizes him, holds him fast for years and rears him into what he is to be. If a school is fate to a Swiss child, the vision comes to him pleasantly in likeness of a fairy. The fairest edifice a Swiss can see, when he goes out to walk, is his village school, his city school, or his cantonal school. The court-house, jail, town hall may be concealed in some obscure corner, but a school is sure to be in sight, the pride of every village slope and every city square. In travelling over Switzerland last summer there was not one court-house of sufficient architectural dignity to attract attention; a nearly two years' residence in Berne has not discovered that legal forum (which, in every American city, is the most conspicuous structure), but everywhere are to be seen commodious and handsome public school buildings. With the exception of the Federal Hall at Berne, and the Federal Tribunal at Lausanne, the Polytechnic, in Zurich, is the finest edifice in the country. The children are so much accustomed to regard the school-house as the foremost building in a city that it is related that a Swiss, with his child, visiting France, and, being at Versailles, he heard her clap her hands and cry with glee, "Look here, papa; here is the school-house!" It was the garden front of that magnificent pile. The school in Switzerland is made to the child, by public and private acts, a centre of happy thoughts and pleasant times. It shares the joys of home and the rewards of church. At school a Swiss boy finds his mates with whom he learns to sing and play, to drill and shoot. The teacher is to him a father. With that teacher he will grow into a man, assisted on his way with care and love, unmixed with either foolish fondness or paternal pride. All bright and pleasant things are grouped about him, and in after-time those class-room days will always seem to him the merriest of his life.

Philanthropy and love of home, two very prominent Swiss characteristics, the un-failing and fruitful source of so many virtues, make the people desirous of giving every chance to their children; and they are proud of and cheerfully spend their money on their schools. The school, the pupil, the teacher, are forever in the public eye. The scholars promenade the streets with music, flags, and songs. All men make room for them, salute them, glory in them as the highest product of the state.

The Swiss school organization proper may be said to date from 1830, and has for its basis the system of Pestalozzi (originally developed here by that celebrated philosopher and savant, who more than a century ago lived at Yverdun, his school-house being an ancient castle erected by the Count of Zähringer in the twelfth century), a system that has furnished a model for the rest of Europe, and especially for Germany. The department of public instruction is the most important and expensive branch of the cantonal government. The two great items of expense which appear in the budget of a Swiss canton are the roads and public instruction. The sums bestowed on these are immense, relative to the total means of the cantons, standing far ahead of the army, which is a very startling fact in Europe, where the cost of the public forces, in times of absolute peace, is nearly fourteen times that of the public schools. The last report published for 1887 shows that the twenty-two cantons expended for schools about 10,800,000 francs, which is the product of school tax, cantonal and commercial. The amount appropriated for the purpose at this time is known to be very much larger, but cannot be accurately given; yet, as giving an approximate idea of the increase, it may be stated that the amount expended by the canton of Berne in 1877 was 1,692,411 francs, while the budget for this year (1887) sets apart for the same purpose 1,925,531, an increase of 233,000 francs.

Article 27 of the federal constitution is as follows:

"Cantons will provide for sufficient primary instruction, which shall stand under the exclusive supervision of the state. It is to be obligatory and in the public schools

gratis. The public schools shall be so conducted that they may be attended by the children of all confessions, without their liberty of faith and conscience being encroached upon. Against cantons which neglect to follow these provisions the confederacy is to take the necessary steps."

It will be observed that primary instruction is thus made obligatory by federal law, and in the public schools gratuitous. This gratuity, by special provisions in many of the cantons, is made to include books and other school materials, and is extended to children of paupers. The Swiss cantons are jealous of their independence in local affairs, and a proposal to appoint a federal secretary of education was rejected by a large majority; but, so far, the cantons have observed in good faith the requirements of the constitution. Each canton has its own school law. The school age usually begins at six or seven and continues to fourteen or fifteen. Compulsory education is not regarded as any interference with personal liberty.

Parents who neglect or refuse to send their children to school are cited before the authorities and fined, and in case of repetition of the offense may be imprisoned. The provision of the constitution guaranteeing freedom of faith and conscience in the public schools has been complied with by the cantons, in a way suitable to their wants, with no unfair dealing, no proselyting, and no complaint. All the schools have religious instruction, and by common consent it partakes of the character of the majority: Catholic instruction in Catholic cantons, and Protestant in Protestant cantons. Preachers cannot be officially nominated as inspectors, presidents, or members of the school regents, but they may take these places by popular election, which frequently occurs in the Protestant cantons. It is yet a disputed question whether persons who belong to religious orders, claiming allegiance paramount to the state, can be teachers in the public schools. The schools may be classified into primary, intermediate, universities, and seminaries, or normal Schools.

The organization of the primary schools is under cantonal supervision. Generally each commune has a public primary school adequate to the demands, and graded as to age and progress. These schools are day schools, with annual vacations from ten to twelve weeks, and are supposed to embrace the pupilage for the first five to six school years. The lessons average from twenty to thirty weekly. The pupils of the upper classes who are old enough to assist at work at home are permitted to attend school one-half of the day during the summer, or to attend what are called supplementary schools, with only six to ten lessons per week. The expenses of these schools are defrayed by the communes with a subvention from the canton, varying much in amount, yet enough so that the public primary schools are free, as required under the constitution. The course of studies in the primary schools embraces: 1. Religion; 2. Native language; 3. Ciphering; 4. Writing; 5. Physical and practical geography; 6. History of Switzerland; 7. Elements of natural science; 10. Singing; 11. Gymnastics; 12. For girls, manual work of knitting and sewing.

Connected with the primary schools in some cantons are what are called *Secundär-schulen* or secondary schools. These are open during the winter months in the evenings and on Sundays, and the course includes book-keeping and business composition, such as letters, bills, contracts, obligations of various kinds appertaining to trade and industry. In many cantons these supplementary or advanced divisions of the primary schools are both free and obligatory; in others voluntary with an average charge of 5 francs. In the cantons of Lucerne and Zurich the children from the primary schools are given four years of gratuitous tuition in these secondary divisions. At the close of the year 1884 there were reported in attendance at the primary schools 455,493 pupils, under the care of 8,763 teachers. Sixteen cantons provided 437 secondary schools with 28,500 pupils.

The intermediate schools present much variety and have only one feature in common, that they represent a higher grade than the primary with an enlarged and more deepened course of study, extending to elements of literature in the mother tongue, composition of advanced kind, reading of classical authors, higher mathematics, and a foreign language; for the German and Italian cantons, French; for the French cantons, German. Geography and history also become much extended. These schools do not have any pretensions beyond what their title of "intermediate" indicates. There are many branches and grades within these intermediate schools. There is what is called the district school and under-gymnasium. In these still more advanced literary, technical, and artistic instructions are given. The ancient languages, Greek and Latin, Natural History, Physics, Chemistry, etc., are taught. In most of the cantons these schools are free, and where a charge is made it runs from twenty to forty francs for the scholastic year. The bulk of the expense is sustained by the communes; some of the cantonal governments, as in Berne, pay one-half of the salary of the teachers and stipends of fifty to one hundred francs to meritorious students wishing to pursue their studies in the higher schools.

The highest degree of the intermediate schools is the high school or gymnasium. These are all subject to cantonal control, with the exception of the canton of Berne, where they are city schools and under the municipal authority. They are divided into gymnasiums, industrial, technical, and commercial schools. The course is three years, except the commercial, which is only two years. The age of admission is from sixteen to seventeen years. The annual charge is from ten to one hundred francs. They are designed as preparatory schools for a university or a polytechnic course. The latest report gives the number of these schools as 58, with 12,500 pupils. As a fair sample the weekly curriculum of a first-class gymnasium for girls in Berne is as follows:

Days.	7 to 8 o'clock.	8 to 9 o'clock.	9 to 10 o'clock.	10 to 11 o'clock.	2 to 3 o'clock.	3 to 4 o'clock.
Monday.....	History	German	Arithmetic..	Gymnastics.	Drawing.....	Drawing.
Tuesday.....	Religion.....	French.....	Natural his- tory.	Singing.....	Study	Study.
Wednesday.....	Arithmetic.	Geography..	German	French.....	Holiday.....	Holiday.
Thursday.....	Religion	Singing.....	History	German	Book-keeping.	Gymnastics.
Friday	French	German	Natural his- tory.	Arithmetic..	Study	Study.
Saturday	Religion.....	French... ..	Geography..	Arithmetic..	Holiday.....	Holiday.

Universities.—There are four of these institutions in Switzerland, located at Basel, Berne, Zurich, and Geneva. The one at Basel was founded in 1460, the others since 1832. These universities are governed by a rector and a senate subject to cantonal control, and are divided into four faculties of theology, jurisprudence, philosophy, and medicine. They will compare favorably in teaching power, apart from the mere accessories of endowments and splendid buildings, with any universities to be found. The tuition depends on the number and character of recitations, being from 2½ to 10 francs per week and one hundred to two hundred francs per annum. The degrees conferred are equivalent to that of doctor in the German universities and bachelor in the French universities. The matriculates in these universities last year were 2,271, including 107 female students, and divided thus: Geneva, 729; Berne, 658; Zurich, 521; Basel, 363, and employing some three hundred professors. In addition to these there is a polytechnic school at Zurich, founded in 1835. The property and improvements were presented by the canton to the confederation, which sustains it by liberal annual appropriation, and the federal budget for 1877 provided three hundred thousand francs for building improvements, being a portion of one million francs contemplated to be used for the same purpose. There were in attendance at the polytechnic last year seven hundred and two students, employing ninety professors.

Seminaries, or normal schools, are established by the cantons and controlled by a director of council of education. Matriculates are received after passing through the secondary schools and their attendance is from three to four years; they are usually lodged and boarded in the seminaries, involving a cost of one hundred and fifty to four hundred francs yearly. To assist poor students whose diligence, promise, and general deportment are marked there are free and half-fee places provided. The number of students at these seminaries in 1886 was 1,223: males 835, females 398. It is estimated that in 1886 the elementary schools, including the secondary and middle-class schools, had a total number of students and pupils of 525,000. The total population between five and fifteen years of age at the census of 1830 was 573,713. To handle this large number of students it required about 5,500 schools and over ten thousand teachers. To this must be added the 2,973 students attending the universities, with 390 professors and the 1,223 students attending the seminaries. Still this does not complete the list, for there are prosperous academies and high schools, such as those at Lausanne and Neuchatel, of which no reliable statistics are available. Then private schools are permitted, the cantons reserving the right to name the conditions under which they will be authorized. Between all the public schools, from the lowest upward to the highest, there is an "organic connection," the university in this natural continuation and correspondence crowning the work begun in the primary school.

The teachers of the public schools are nominated by the school commission and selected by an assembly of the commune. Teachers of the higher schools are appointed by the cantonal director of education and confirmed by the board of education. Each commune must pay to the primary school teacher a minimum salary of 550 francs; but these salaries will run from six hundred to one thousand francs, with free lodging and fuel. Those in the cities receive from 1,200 to 1,700 francs; secondary school teachers, from 2,200 to 3,300 francs, and teachers in the gymnasiums an average of 3,300 francs.

Those teachers are elected for six years, and after service for a certain period are pensioned. The cantons assist the communes in augmenting the lower salaries and the payment of the pensions.

After thirty years of service a pension is paid of not less than half of the salary, which was received at the date of retirement. In some cantons, after five years of service, one hundred francs are added to the salary, and an additional one hundred francs for each succeeding period of five years. In Basel a female teacher, after ten years of service, is entitled to a supplementary pay of fifty dollars per annum; after fifteen years, seventy dollars per annum; and then on retiring, after the fifteen years, a pension for life of two per cent. on the whole amount of salary received during the term of active service.

As a rule the schools are not mixed, and when the commune is not able to sustain separate schools the boys attend in the morning and the girls in the afternoon. In every hamlet where there may be twenty boys and girls a school is provided. All scholars have daily tasks to do at home; the task at home is nearly equal to the task at school. The hours of study, school work, drill and home work, are frequently from ten to twelve hours daily. Indeed, you may say that Swiss children tug at learning in a way that would create a rebellion with the young American.

No week day is a holiday, like the Saturday with us. Each class has so many hours of schooling a week, covering the six days. Singing and gymnastics are taught in the course, and both with reference to a due development of the physical and moral powers.

In other countries it is the political or governing class which establishes popular schools for the benefit of the masses. But in Switzerland the people—the commune—establishes and sustains the school for its own benefit. The same general equality of conditions prevails as in the United States, and the public schools are freely used by all classes, and their establishment and maintenance is a composite charge, made so by the fundamental law. Here is found a full realization of the demand that a career shall be open to all talents; for no system of education can be truly solid, and sound, and democratic, which does not make it possible for the child of superior merit, however humble and poor, to mount the highest round of the educational ladder.

Every canton has in its organic law some expression embodying the idea that the business of a public teacher is to make his boys good citizens and good Christians. In some cantons the distinct announcement is found that the true end of public instruction is to combine democracy with religion, so that every boy attending a public school may grow up into a good citizen and a good Christian. In the law of Zürich it is declared, "The peoples' school shall train the children of all classes on a plan agreed upon, to be intelligent men, useful citizens, and moral and religious people." In Lucerne we find this: "It shall train them for life in the family, in the commune, the church, and the state." In fact, they all bespeak the ineffaceable influence of that great Swiss pedagogue, who uttered that memorable invocation, "Patron saint of this country, announce it in thunder-tones through the hills and valleys that true popular freedom can only be made possible through the education of man."

The Swiss methods of teaching are more gradual, natural, and national than ours—the teaching is less mechanical. There is a patience, the avoidance of our hurry, the being content to advance slowly, the firm securing of the ground passed over. The fundamental maxim with them is from the intuition to the notion, from the concrete to the abstract, founding habits of clear apprehension and clear expression. The system seems to be less wooden than ours; it may result from a regard for the fact, so often overlooked, that variety in mental food is as important as in bodily food for healthy growth, and that children at school are often tired and listless because they are weary and bored. From this, relief is found in singing, drill, and gymnastics; and every effort is made to interest the children and to adapt the methods to their mental processes. It is a common practice with our teachers to give children the rule for doing a sum and then to test them by seeing if by that rule they can do so many given sums right. The notion of a Swiss teacher is that the school hour for arithmetic is to be employed in ascertaining that the children understand the rule and the processes to which it is applied. We put the abstract before the concrete; the Swiss works in the opposite way. Their instruction, in other words, aims to render the pupils capable of solving independently and with certainty the calculations which are likely to come before them in their ordinary life. In each branch of instruction this plan and object are prescribed for the teachers, and it is thought these are best attained by oral teaching and questioning. In one word, they possess and follow a carefully matured service of pedagogy. The attention is easily maintained in spite of the long hours, for at frequent intervals, at least every two hours, the class disperses for a few minutes to the corridors or play-grounds, and the teachers lead and assist on the play-ground as much as they do in the school-room—a companionship of teacher and pupil that is very beneficial and beautiful. Every form of corporal punishment is forbidden. No bodily pain nor bodily shame is suffered in the schools; and this is a true and correct theory of school discipline.

A professor, whose school in Berne it has been my pleasure on several occasions to visit

for purposes of observation, said to me: "A lad has rights; we cannot stunt his food; we cannot lock him up; we cannot put him in a corner; we cannot crown him with a dunce cap; we cannot make a guy of him; our discipline is wholly moral. Our means are prizes, good words; all leading up to public acts of honor. Desire to win a prize has more effect than fear of punishment. Franks and mischief take time, and boys who are ambitious to win the prizes have no time to spare for such purposes." But I said to him you must have some rough types. What means have you of keeping the unruly spirits in order? He answered, "We expel them; but such an emergency rarely occurs. A threat or admonition suffices. In truth, to be expelled from a school is considered only one degree from ruin. When expelled one cannot go to another school. The laws about exchange of school are very strict. No change can be made without a special leave in writing from the inspector of the district school. Expulsion is a public act, and there are three degrees. The first is a forbidding of the school, it may be for a day or a week; and when he returns his parents must come with him and must promise he will mend his ways. The second is removal for a longer period, a month, a quarter perhaps, when he can only resume his place by an express authority from either the inspectors of his district or his village mayor. The third expulsion is a formal and serious official act; the teacher and inspector must unite in recommending it and the educational department must concur." It will be seen that the law considers that every child has a right to come to school, and that this right can be taken away only in strict conformity to the method prescribed. Of course this does not apply to the exclusion of children in cases where the public good and safety is involved, such as children who have failed to be vaccinated or are suffering from loathsome diseases or present disfigured and repulsive forms or faces. There is very little contumacious absence; the children have the habit of going to school as a matter of course and the parents equally the habit of acquiescing in their going.

Therefore the discipline is almost entirely one of self-respect and self-restraint. The children are taught how to think and act, no less than how to read and write. Instruction is made but a part of their education. As much attention is paid to the things of life as to the things of learning. The child's manners and appearance are properly cared for. How he walks, stands, and speaks. That his hands are washed and that he keeps his papers clean. He comes to regard a blot upon his page to be as bad as a smudge upon his face. Said this same professor to me, "A book befouled with grime is wasted and our simple habits will not suffer such waste. Turn over any of these books which are in daily use, no leaf is torn or dog-eared, and no cover defaced with scribbling."

The same observations could have been extended to the furniture and the buildings. The desks, though extremely plain, looked as if they were daily washed and polished; not a spot or splash of ink was to be seen on their bright surface. The large halls and spacious staircases showed no scratch or scrawl of the walls and no bits of paper on the floors. The children are evidently used to strangers visiting their schools, since their attention does not for a moment leave their work, to gaze in wondering curiosity at them. You look around the room containing some fifty boys or girls from seven to ten years old and when informed that they represent all classes from the patrician to the poorest peasant, your first impression is one of surprise to find them all so neatly and decently clad, and none dirty, ragged, or shoeless. The enquiry is naturally made, How is this? "Yes," they say, "Some, not many, come to us that way, but they do not remain that way long. For dirt is but a habit of the eye, and habits of the eye are quickly changed. We wash the dirty ones and send them home with shining skins. A mother gets ashamed on finding that some other woman, or it may be a man, has had to wash her child. The child also becomes mortified, for all the little ones around him are clean and so two or three school washings result in having it afterwards done at home."

Science teaching is assuming a very prominent position in the Swiss school. This science teaching familiarizes the student with the universe in which he lives, and makes him, in the presence of the great laws and forces of nature, not a stranger but a child at home. It is being accepted that the system of education must be brought into closer relation to the new and far advanced knowledge of the time. It is being recognized that science is one of the moulding influences of the modern world; that it is at the foundation of material progress; that it is the basis on which much of the manufacturing industry and commerce rests; that many of the chief social ameliorations of the day are due to its influence; that some knowledge of science is indispensable in the elementary public school education of to-day. The industrial world has been made what it is by scientific discovery. Its prosperity must depend on the spirit of scientific knowledge among the masses of its workers, and it is only by the practical application of such knowledge to industrial processes that a country can hope to hold its own in the struggle of national competition.

Again, the genius of invention has succeeded in producing by machinery cheap and serviceable imitations of almost every necessary of life hitherto the result of skilled labor; that is, the artisan is daily more and more becoming the servant of automatic

tools. All industries, even the pettiest, tend to centralization in a few hands. In other words, if the work-shop is to hold its own against the factory it can do so only by superior taste and finish, the results of methodical, technical, industrial education and training. It is inevitable that in the struggle for existence the "fittest" will prove to be those who combine intellectual knowledge with the practical knowledge necessary for the production of wealth. The claims of technical education have taken a strong hold on the educators of Switzerland as well as on the broadest and best trained of her public men. They have foreseen the necessity for that delicacy of touch and accuracy of eye (that have made Swiss mechanics, in some departments, the best in the world) to be trained and educated for a supremacy in a field of wider range and more varied scope. This important question is attracting a constantly increasing amount of attention here, and much progress has been made in the establishment of industrial and manual training schools, a review of which it was my purpose to include in this report; but finding that it has already extended to such a length, it is deemed best to reserve for a separate supplemental report technical and industrial education in Switzerland.

EDUCATION IN BRITISH INDIA.

In addition to the statistics of elementary education in India, presented in Table 110, the following information is derived from the latest official report:

Comparisons are instituted with the corresponding conditions for 1881-82, the year in which the royal commission investigated the workings of the education act with a view to devising measures for the improvement of the system.

In 1881-82 there were 3,932 secondary schools for boys, attended by 215,731 pupils; 149,265 attending the English and 66,466 the vernacular side. In 1885-86 these schools numbered 4,083 and the pupils 394,503; 264,918 receiving a purely English education. In 1886-87 there were 4,160 schools and 404,189 students, of whom 271,654 were in the exclusively English division. During the last five years the number of male pupils receiving a purely English education, introductory to a university course, increased 80 per cent., while the number of boys receiving a superior mixed English and vernacular education was doubled.

In 1886-87 the 7,678 advanced private schools were attended by 77,379 students, learning Persian, Arabic, Sanskrit, or some other Oriental classic. The secondary schools for girls, which in 1881-82 numbered only 190, attended by 6,366 pupils, in 1885-86 had increased to 349, attended by 23,904 pupils, and in 1886-87 to 357 schools, attended by 24,904 pupils.

The third and highest division of the Indian educational system, the collegiate section, comprises arts, law, medicine, engineering, and teaching. In 1881-82 the number of colleges in India was 85, the attendance numbering 7,532. In 1885-86 the colleges numbered 110, and the attendance 10,538. In the following year 114 colleges were attended by 11,501 pupils. In 1881-82 the sixty-seven art colleges, English and Oriental, were attended by 6,037 scholars; in 1885-86 eighty-six of these colleges were attended by 8,127, and in 1886-87 eighty-nine colleges were attended by 8,674. There were twelve law colleges in 1881-82, with 739 students. In 1885-86 there were sixteen, with 1,371 students, and in 1886-87 the same number of colleges, with 1,602 students. In 1881-82 there were three medical colleges, with 476 students. In 1885-86 the three colleges had 584 students, and in 1886-87 the colleges were four in number, and the students 654. The engineering colleges, which in 1881-82 numbered three, with 330 students, rose in 1885-86 to four, with 447 students, and in 1886-87 the same colleges had 474 students.

Passing from the statistics of attendance to those of expenditure, in 1881-82 the total cost of public instruction was \$6,435,600. Four years later the total had risen to \$8,304,000, and in 1886-87 to \$8,719,200. At the beginning of the five years the Government bore 39 per cent. of this expenditure, while local and municipal funds contributed 17 per cent., the balance consisting of fees, subscriptions, and endowments. In 1885-86 the share of the Government was 33 per cent., the local and municipal bodies supplied 20 per cent., and the public the balance. The share assigned to local bodies does not entirely proceed from local taxation, as it includes a small sum contributed by the Government.

The governor-general in council considers that the proportion of the growth borne by local bodies should for the future exhibit a more marked increase than it has shown since 1885. There should be a tendency to decrease rather than to increase the proportion now defrayed from the public treasury. Technical education should only be supported by the Government as an extension of general education, while it should promote such technical education of a special character as may be applied to the service of such existing industries as will profit by scientific research, scientific methods, and higher manipulative skill.

CHAPTER XX.

PAPERS ON EDUCATIONAL SUBJECTS.

LIBRARIES AS RELATED TO THE EDUCATIONAL WORK OF THE STATE.

READ BEFORE THE CONVOCATION OF THE UNIVERSITY OF THE STATE OF NEW YORK,
IN THE SENATE CHAMBER, ALBANY, JULY 1, 1888.

By MELVIL DEWEY,
Director of the Columbia College School of Library Economy.

There runs a tradition of our craft "The librarian who reads is lost." Who writes is indeed without hope. How grave his case who tries to make a speech! The modern librarian is too crowded with daily work to bring you carefully rounded periods or polished sentences. He is content if able to make his meaning clear and lodge the thought of his mind in yours.

You listen from year to year to special pleaders. Each man, as a rule, tries to magnify his office, and demonstrate that the topic in which he feels special interest is clearly first in importance. He pleads for vocal music, elementary science, hygiene, gymnastics, ethics, manual training, civil government, drawing. We are convinced of the value of every one, but alas, the list of necessary studies is like art, long, and school life for most of us pathetically short. We are forced mentally to brace against the carefully prepared points of the advocate. For three reasons I ask you to-day to follow me without this customary bracing against extreme views.

1. I do not magnify my office because it is mine, but rather have chosen it as a life-work because unable to escape the conviction of its superlative importance to education.

2. I come to you without carefully prepared arguments, and ask you simply to answer to your own minds my plain but vital questions.

3. Most important, the action to which I seek to lead you, instead of taking more time, means relief to your overcrowded curricula.

What I propose you will see is no entangling alliance, but rather is annexing a continent. Were there time I should speak of the admirable work that has been going on in both east and west for the last five years between the schools and libraries. This has met with hearty recognition, has been often described in print, and is making its way rapidly through the country. But this is only the introduction to that deeper relation and recognition which is in the immediate future.

And let me remind you before we begin that the library for which I speak is one which few of us have seen, except in promise. It is a library at present in its infancy. Remember your own history. "Schools" were old when Paul sat at the feet of Gamaliel and the quick-witted Greeks hung on the words of their teachers in the academy, lyceum, and the porch. But schools like those of which this convocation is the crown are *young*. When in this discussion we speak of schools, we mean that ideal for which we strive, which ought and is to be. Observe the golden rule, and when we speak of libraries picture that ideal which I will briefly sketch. Go back neither to the storied bricks and slabs of Nineveh and Babylon, nor to the myriad MSS. of mighty Alexandria, nor, coming to our own time, to those institutions which in our library evolution correspond to Squeers and Dotheboys Hall.

We have many libraries still which have naught in common with our ideal, except books and the name; many that seem still carefully administered for the least good to the smallest possible number. Our evolution comes after yours. We are not so far advanced. Barely a generation ago the harmless incompetent, fit for nothing else, was set to teach school. But in their dignity and strength most schools have now crowded out the incompetents. The libraries are following, and already the idea is giving way

that men and women, who fail in everything else, and can get neither church nor school, patients, nor clients, are just the ones for librarians. Glance with me a moment at a sample of the old library and the new.

The old was located in an out-of-the-way street, specially inconvenient to the majority who might want it; the building was unattractive, dark, damp, cold, unventilated, and ingeniously inconvenient; many of the books were on shelves so high as to require a ladder, were covered with dust, in shabby bindings, protected often with shabbier paper covers, soiled, torn, and generally discouraged in appearance; unused public documents, old school-books, etc., nearest the door, the more attractive works in the attic or cellar; the shelves unlabelled; the books without numbers on the back, and possibly with none inside, and put on the shelves haphazard as they had come in, or in a classification so coarse that a reader seeking matter on a minute topic might require a week to look over the disorganized mass of literature in which he might or might not find something that he wished; its catalogues and indexes were chiefly conspicuous by their absence, or were so meagre, unreliable, and so destitute of clear grouping that the only way to find what was wanted was to read the whole catalogue. The library was open an hour or two now and then, and closed evenings, holidays, and vacations, for annual cleaning or for almost any excuse—on busy days, because no one had time to come; on holidays, because the librarians also wanted those days for rest. Finally, and most important, the old type of librarian was a crabbed and unsympathetic fossil who did what he was forced to do with an air that said plainly he wished you had not come, and a reader among his books was as unwelcome as the proverbial poor relation on a long visit. It is a sorry picture, but by no means wholly fanciful. In many places those who knew would pronounce it a study from life.

Contrast all this with the library as it should be, and in many cases will be. Placed centrally, where it is most accessible to its readers; the building and rooms attractive, bright and thoroughly ventilated, lighted and warmed, and finished and fitted to meet, as fully as possible, all reasonable demands of its readers; the books all within reach, clean and in repair; those oftenest needed nearest the delivery desk, labelled and numbered; arranged on the shelves so that each reader may see together the resources of the library on the topic which he wishes to examine, kept constantly ready for inspection; with simple and complete indexes and catalogues to tell almost instantly if any book or pamphlet wished is in the building; open day and evening throughout the year, and in charge of librarians as pleased to see a reader come to ask for books or assistance as a merchant to welcome a new customer; anxious to give, as far as possible, to each applicant at each visit that book which will *then*, and to *him*, be most helpful.

These are the facts. The old library was passive, asleep, a reservoir or cistern, *getting in* but not giving out, an arsenal in time of peace; the librarian a sentinel before the doors, a jailer to guard against the escape of the unfortunates under his care. The new library is active, an aggressive, educating force in the community, a living fountain of good influences, an army in the field with all guns limbered; and the librarian occupies a field of active usefulness second to none.

We will speak then of the relation of schools and libraries as they ought to be, and not of the failures of the past.

It takes the world a great while to learn what seems afterward very simple lessons. A happy thought sometimes revolutionizes the common practices of centuries. It comes out as clear as lightning in the darkness and the world recognizes and accepts it, as witness the telegraph and telephone and other modern miracles. Sometimes the new idea crystallizes so slowly that it seems like a geological formation. But whether with swiftness of light or slowness of granite the world moves steadily forward.

I suppose the man who first proposed attaching a wagon to the horse and making him draw that as well as his load was voted as great a visionary as the modern flying machinist. But when on a smooth road he proved that the same horse could draw ten times as much as he had carried, why the wise old world said "the man is right. Go to, now, let us build ourselves wagons." Then the obstructionist (for the dear, dreadful, omnipresent old fossil was surely there) said, "In spite of his proof, the wagons are useless for they cannot run on our bridle paths." And there was truth, as there often is, in the obstructionist's position. But the world that built the wagons has built the roads. And when we remember that the builders have gone on to cross the continent with roads of iron and were not dismayed at the great span of the Hudson at our feet, or at the huge Hoosac bulk which we can almost see beyond the other shore, you will hardly think the task too great to build the road of which I am to give you a bird's-eye view to-day.

If you will follow me you will recognize that without the libraries our schools can do but a fraction of their work. They are horses without wagons, engines without cars, canals without boats, except such skiffs and scows and rafts as chance may throw upon their waters. We must have proper carriages as well as motive power, and then must make suitable provision for broad and straight and level roads.

We are spending our time and money with a freedom of which all the world is proud,

to give our youth in our public schools not much information or culture, but only the simplest tools which, if rightly used, will enable them to educate themselves by reading.

Of old it was only the learned few who could read; most of the world were limited to conversation. Now, we are told this is an art more rare than music, and only the educated few are able to converse; but, except illiterates, everybody reads. Less and less from living voice, from pulpit or rostrum, and more and more from printed page, re people getting their ideas and ideals, their motives and inspiration. The mass of knowledge credited to nature and observation comes most of it, not directly, but through print. The eye, not the ear, is the great gate to the soul. The town-crier no longer rings his bell and shouts his message through the streets. Even if told orally, most readers wish to see "how it looks in print," as an average reader of French wishes to see rather than hear the words. All that is worth knowing soon gets into type. What a boom if such only were printed!

As we study the question, it becomes clear that the difficulty and expense of reaching the people by the voice, and the cheapness and permanence of print make it necessary, if we are to educate and elevate the masses and make their lives better worth living, that we should, in some way, put in their hands the *best* reading. I say best, for reading is not necessarily good or elevating, though it certainly averages much higher than conversation because much greater care is taken in its preparation. Labor and cost bring into activity the law of survival of the fittest. But if good books average higher than good conversation, bad books are more powerful for evil; for when ideas good or bad get into book form, they are apt to become vastly more potent. We have thus a double reason for our missionary work; to give good reading for its own sake and also as the best means to drive out and keep out bad. To teach the masses to read and then turn them out in early youth with this power and no guiding influence, is only to invite the catastrophe. Human fashion, they are quite as likely to get bad as good. The downhill road is ever easiest to travel. The world agrees that it is unwise to give sharp tools or powerful weapons to the masses without some assurance of how they are to be used. Even George Washington got into mischief with his first hatchet.

The children of another generation will see nothing especially wonderful about the telephone or electric light. So we, born to constant sight and use of books, seldom stop to think what a miracle they are. As distinguished from the brute the savage has the divine gift of speech. And when we think that the vibrations of the air started by the vocal chords convey to another the workings of the human soul, we no longer wonder that speech has been looked on as the direct gift of the Almighty, a power too wonderful to have been invented by man. And when, a step higher, the image of his Maker discovered the art of writing, and learned to make spoken words permanent on wood or stone or clay, we do not wonder that the savage worshipped the chip that could talk or the bit of paper that unaided made a complete communication. Has there been anything in the world's history so wonderful as a modern book?

And remember that of late years the printing press has called to its aid graphic methods, color, form, the curves and co-ordinates of geometry and the many photographic processes, so that in many cases the book makes the author's meaning clearer and more easily understood than would be possible for a score of authors with the living voice. In proof of this consult some recent statistical atlas or the profusely illustrated volumes in science. Or take this very point of illiteracy: Here is a map on which is indicated by darkness of shading the amount of illiteracy in each section. Or to be more exact, here is a page with the list of all the States at the left, followed by columns representing each decade of this century, with the dates at the top of the page. Running across this page, opposite each State, is a curved line indicating by its height above the ruling, the percentage in that State that cannot write; for each year the rise and fall of the lines show the fluctuations graphically. A similar line in red opposite the same State in the same way shows the percentage that cannot read. Thus on this single page, at a glance, is told with geometrical accuracy the amount of illiteracy for the whole country; or for any given year, by reading down the proper column; or by reading across, the conditions of any given State during the whole century; or, by consulting the intersections of these columns as on a railroad time-table, the conditions of any place, at any time. No amount of oral statement could begin to give so clear an idea as a few minutes' study of these two pages. Similar methods are being applied to almost every subject of human interest. Recent photographic processes have made exact pictures and all kinds of illustrations so cheap that a modern book, as compared with those of last century, is like a modern lecture on science in which every point is illustrated by experiments performed before the listener or by pictures thrown on the screen by a lantern, when compared with a mere oral statement which, however skilful the word painting itself and however clearly defined in the mind of the speaker were all the ideas of objects referred to, simply *could* not reproduce them as clearly in the minds of the listener.

Emerson says:

"Consider what you have in the smallest chosen library. A company of the wisest

and wittiest men that could be picked out of all civil countries in a thousand years have set in best order the results of their learning and wisdom. The men themselves were hid and inaccessible, solitary, impatient of interruption, fenced by etiquette, but the thought which they did not uncover to their bosom friend is here written out to us, the strangers of another age."

And his friend Carlyle adds:

"Of the things which man can do or make here below, by far the most momentous, wonderful, and worthy, are the things we call books."

Reading is a mighty engine, beside which steam and electricity sink into insignificance. Four words of five are written: "It will do infinite——." It remains for us to add "good" or "ill." What can we do? Good advice and example, encouragement of the best, addresses, all these help, but no one questions that the main work is possible only through the organization and economy of free public libraries. Many have practically accepted this fact without clearly seeing the steps that have led to it. It is our high privilege to live when the public is beginning to see more than the desirability, the absolute necessity, of this modern, missionary, library work.

With the founding of New England it was recognized, though opposed to the traditions of great powers in church and state, that the church alone, however great its pre-eminence, could not do all that was necessary for the safety and uplifting of the people. So side by side they built meeting-house and school-house. The plan has had a long and thorough trial. None of us are likely to question the wisdom of bringing the school into this prominence, but thoughtful men are to-day, more than ever before, pointing out that a great something is wanting and that church and school together have not succeeded in doing all that was hoped or all that is necessary for the common safety and the common good. The school starts the education in childhood; we have come to a point where in some way we *must* carry it on. The simplest figure cannot be bounded by less than three lines. The lightest table cannot be firmly supported by less than a tripod. No more can the triangle of great educational work, now well begun, be complete without the church as a basis, the school as one side, the library the other. The pulpit, the press, and wide-awake educators everywhere are accepting this doctrine. There is a general awakening all along the line. The nation is just providing in the Congressional Library a magnificent home for our greatest collection of books; the States are passing new and more liberal laws to encourage the founding and proper support of free libraries; individuals are giving means for establishing these great educational forces as never before. Witness Walter Newberry's three millions to Chicago, Mrs. Fiske's million and a half to Cornell University, Enoch Pratt's million and a half to Baltimore, Judge Packer's half-million for the library of Lehigh, Andrew Carnegie's proffered quarter-million to Pittsburg, and proudly at the head, greatest of all library gifts, Governor Tilden's five to ten millions left to New York, not to mention the hundreds of smaller gifts which mark the last few years. New, large, and beautiful buildings are being rapidly provided; new libraries are being started at the rate of one to three each week; old ones are taking on new life and zeal; Sunday-school and church libraries are organizing to enlarge and make their work more effective, and a great field of usefulness, at present hardly realized, is opening in this special direction; schools are being brought into direct and active relations with local public libraries. To one studying this great problem, the air is full of the signs of the time. As with the free school, so again, New England leads in free libraries, but her example is being followed with constantly increasing rapidity.

Our fathers had to revise their ideas and introduce the free schools as an essential factor. The time has come when we must revise our conceptions of education, or refuse to recognize very significant facts.

Education is a matter of a life-time. We provide in the schools for the first ten or fifteen years and are only come to the threshold of seeing our duty to the rest of life. We begin to see that the utmost that we can hope for the masses is schooling till they can take the author's meaning from the printed page. I do not mean merely to pronounce the words or pass the tests for illiteracy, but to *understand*. Observation has convinced me that the reason why so many people are not habitual readers is, in most cases, that they have never really learned to read; and, startling as this may seem, tests will show that many a man who would resent the charge of illiteracy is wholly unable to reproduce the author's thoughts by looking at the printed page. And even with this tremendous modifier of the real number of readers we lose ground. I am no pessimist. I have no sympathy with croakers. I am proud to the last degree of the great work that is being done. But we cannot shut our eyes to the census. In 1870 fifteen per cent. of illiterates seemed an ugly item, but it had grown to seventeen per cent. in 1880, in spite of all our millions and all our boasts. Of the children of school age in this great State, how pitifully few get beyond the grammar school? And of those who become academic pupils, how many enter college? And to the saving remnant that graduates from college, how much of the knowledge of after-life came from schools and how much from

reading? We must face the facts. We must *struggle* to teach our masses to read in our schools. Then they must become bread-winners; and if we carry on their education we must do it by providing free libraries which shall serve as high schools and colleges for the people. Our schools, at best, will only furnish the tools (how rudimentary those tools for most people now), but in the ideal libraries, toward which we are looking to-day, will be found the materials which, with these tools, may be worked up into good citizenship and higher living. The schools give the chisel; the libraries the marble; there can be no statues without both. As this fact becomes more generally recognized, the time draws nearer when the traveller will no longer ask *have you a library*, but *where* is the library, assuming its existence as much as he now assumes that there must be a church and school and post-office.

But if the library is to do the ideal work that we have in mind it must have some of the ideal qualities on which such work depends. This means a library differing materially from both the types most familiar in the past, which we may call storage and recreation libraries. The first is a store-house, a cistern, an arsenal, mediæval in its spirit, a literary miser, always getting in, seldom giving out. It was for holding and preserving, and not for use, and is best illustrated by the miser who gets gold not to spend, but merely for the satisfaction of possession. The European libraries are largely of this character, as are most State and government collections.

The recreation type is a mental candy shop, and at the other extreme in every feature. It is wholly for use, but the use is wholly for amusement. It could be illustrated by a school that taught only games, or a hotel that in its dining-room served only sweetmeats. It has, to be sure, some excellent books, but supplied to meet the taste of its pleasure-seekers, as the confectioner gives those who wish it a bit of good bread to eat with their ice-cream.

Surely every library ought to have an ambition to get and preserve books, and surely some place should be found in every general collection for fiction and humor. These ought, however, to be the embroidery, and not the web. A circulating library, run as a business, will of course take on the latter character, and supply whatever will be most readily taken by its customers. But the library in which we are interested to-day combines the good features of both these with others of its own, and is the institution that deserves the name of people's university. It might well copy that broad legend from the seal of Cornell, "An institution where any person may find instruction in any study." Perhaps we should more clearly recognize its proper functions and be in less danger of confusing it with old ideas if we called it not a "library," but a "people's university."

To the making of such a library many elements contribute. A building will not do it, though it be as beautiful as the Taj and as great as the Coliseum. Money and books, though essential, will not of themselves make such a library. I recall visiting a magnificent building on which about a million dollars had been spent. In it were many valuable books. It was in a great city, and a thousand readers daily ought to have found their way through its open doors. When I looked with surprise at the four or five readers who seemed lost in its superb rooms, my witty friend, the chief librarian, said, "Why, there is hardly a day passes that some one does not come into this library."

And I recall a similar illustration which came under my personal knowledge. The detective force of a great city were in hot pursuit of a man who thought it impossible to hide from them. A literary man, to whom he had done a favor, undertook successfully to secrete him through the entire day, and after dark he escaped. The place chosen, where he would be least exposed to recognition from chance observers, was in the public reading-room of a great library, which, like the one before mentioned, was famous for the number of people who did not go there.

We have no time to-day to go into the questions that determine a library's measure of success. Mere mention of heads must suffice. Its location should be central and accessible to all. Its building should be comfortable and convenient. Grandeur plays no part in usefulness. Its hours of opening should be long, for the people's university, like the town pump, should seldom be closed to those needing it. The regulations should be liberal, with as little red tape as is consistent with the safety of the books. It goes without saying that books, pamphlets, and serials should be well selected and as liberally provided as means allow. It would be hard to find a library in which from ten to fifty per cent. of its books could not be replaced with others more valuable for its use. In fact it is common to find collections where, if the very best could be chosen from the open market, one-quarter the number of books would have more value than the whole miscellaneous assemblage. After the book come the little-understood catalogues, classification, and analysis, which vastly increase their practical value.

Only those with special experience can understand how essential to any high success are such appliances. Working in a library without them is like trying to find a score of men in a great city without a directory. You may chance on some one who knows the man you seek and can direct you to him, but the chances are that you will have a long disheartening search and perhaps fail entirely to find him.

Finally, and perhaps more important than all the rest, is the librarian. If he can furnish inspiration and guidance to the readers who seek his help then may we indeed look for a true university, whether large or small, for the small library should have all the high ideals of the large with the best of their books.

And such a library is the real university for the scholar as well as for the people. Of old the pupil was continually with the teacher, and from his lips learned the sought-for wisdom; but the printing-press has revolutionized all this, and to-day many an earnest disciple has never seen the face nor heard the voice of his master, but has received all his teachings through the printed page. The "new education" is chiefly distinguished by substituting the library for the text-book and dogmatic lecture. Seminaries are springing up in the best colleges in all departments. Students are taught to work in the library as the main object of their course, and when one is able to use skillfully a large bibliographical apparatus and to get quickly and accurately from a great library what he needs, he may indeed claim to have a good education.

Of late years the college library has been taking an entirely new position. Of old it was attached to the chair of some overworked professor or put in charge of the janitor and opened four or five hours per week in term time only. Now it is being raised to the rank of a distinct university department; there are professors of bibliography, of books and reading, and at Columbia we have for the first time a chair of Library Economy. The libraries are being made as accessible as the traditional college well, some of them opening from 8 a. m. to 10 p. m., including all holidays and vacations; they are receiving endowments, *e. g.*, the million and more to Cornell University. Professor Horsford's great gift to Wellesley, Judge Packer's half million to Lehigh, and the long list of funds given to Harvard, the Phoenix gift to Columbia, and so I might go on with hundreds of illustrations. New and beautiful buildings, some fire-proof, all vast improvements over what was thought sufficient in the last generation, multiply; Harvard, Brown, Amherst, Dartmouth, Oberlin, Yale, the Universities of Michigan, Vermont, and Pennsylvania; in this State Cornell, Syracuse, and Madison Universities, and so on. In New York City alone three splendid collegiate library buildings have just been finished for the General Theological Seminary, Union Theological Seminary, and our own at Columbia, which has cost over four hundred thousand dollars, and already we plan an enlargement. The colleges are waking to the fact that the work of every professor and every department is necessarily based on the library; text-books constantly yield their exalted places to wiser and broader methods; professor after professor sends his classes, or goes with them, to the library and teaches them to investigate for themselves, and to use books, getting beyond the method of the primary school with its parrot-like recitations from a single text. With the reference librarians to counsel and guide readers, with the greatly improved catalogues and indexes, cross-references, notes, and printed guides, it is quite possible to make a great university of a great library without professors. Valuable as they are in giving personal inspiration, they can do little in making a university without the library. Just as truly as we found in popular education that the real school for the mass of people, and for all their lives except early childhood, was the library, so in the higher education the real university is a great library thoroughly organized and liberally administered.

What we need now in higher education is not more colleges, but more libraries. Railroads have largely annihilated space, and for the preliminary training it is easy to send our boys and girls a few hundred miles to college; but for the training that must be carried on all through life they need the people's university close at hand where it may be reached without serious interruptions of regular pursuits. It is like the post-office and market compared to the registry of deeds. One does not object when he buys an estate to go a long distance to record his title, but when he wishes to mail a letter he insists on having a post-office at hand. Higher education therefore demands new libraries at accessible points throughout the State, and their wise and economical establishment requires guidance and supervision such as the regents of the university can best supply. State after State has partially recognized the claim of the library by passing laws allowing communities to tax themselves for its maintenance, and the time has come when the recognition of its true place must be made complete. If New York will not now lead, as is her wont, at no distant day the greatest of the States will have to follow.

If time allowed, I should like to sketch to you the recent development of the modern library idea. I merely mention the great steps, referring you for fuller information to the Library Journal, Library Notes, and the circulars to be had on application at the Columbia Library School. We date active progress from 1876, when, after a four days' successful conference in Philadelphia, the American Library Association was organized. It holds annual meetings, marked among conventions by their practical work and enthusiasm. The same year we started an official monthly organ, the Library Journal, now in its thirteenth volume. Shortly after followed that most important practical factor in the library work, the Library Bureau of Boston, which undertakes to do for libraries such work as is not practicable for the association or magazine. It equips large or small

libraries with everything needed (except books and periodicals) of the best patterns devised by or known to the officers and committees of the association, of which it is the tangible representative for manufacturing and distributing improved appliances and supplies. It secures trained cataloguers and assistants or finds positions for those out of employment, gives technical advice in its consultation department, and in all practicable ways fosters library interests. Ten years after the *Journal*, which, because of its limited circulation, barely pays expenses at five dollars a year, came its co-laborer, *Library Notes*, a quarterly magazine of librarianship, specially devoted to the modern methods and spirit, and circulated widely because of its low price. Last of the great steps came the school for training librarians and cataloguers, which two years ago was opened at Columbia College through the same influence which had before started the association, *Journal*, *Bureau*, and *Notes*. You who appreciate what normal schools are doing to improve our teaching will remember that librarians need a training school more than teachers, who have had the experience of their own school life as a pattern, for librarians till two years ago never had opportunity for training and came to their work like teachers who had been self-taught, and not only had no normal school advantages, but had never been in a school or class room even as pupils. As evidence of the growth of the idea, we may note that this library school, which began two years ago with a twelve-weeks' course and provision for five to ten pupils, has in two years developed to a course of two full years with four times as many students at work, and in spite of the rapidly increased requirements for admission is to-day embarrassed by five times as many candidates as it can receive. This means a recognition of the high calling of the modern librarian, who works in the modern spirit with the high ideals which the school holds before its pupils. Of this work I said recently to the collegiate alumnae:

"Compare this work with that of the clergyman or teacher, whose fields of usefulness are universally put in the first rank. The clergyman has before him for one or two hours per week perhaps one-tenth or one-twentieth of the people in his parish. Not so many, indeed, when we remember how there are often little struggling churches of a half-dozen denominations, where one strong church could do all the work much better. Beyond this very limited number for this very limited time, the clergyman is dependent on the slow process of personal, parochial calls. I yield to none in my appreciation of the great work which he does, and do not forget the constant stream of good influences coming from his daily life, and the many direct efforts he puts forth; but I am speaking now of his work as a preacher, and of the limits which circumstances seem to set to it.

"The teacher has a larger proportion of her constituency in the earlier years, but only for a few hours a day and only in the months when schools are in session. It constantly happens that just as she becomes deeply interested in a bright, promising boy or girl, and feels that here is an opportunity to develop a strong character by patient work, the child comes and says, 'I am not coming to school any more; I am going to work in the factory,' or, 'I am going to help mother at home.' For the great majority the work of education is hardly begun before the necessities of life take them away from the teacher's influence.

"But the earnest librarian may have for a congregation almost the entire community, regardless of denomination or political party. His services are continuous and in the wide-reaching influences of the library there is no vacation. When a bright boy or girl has been once found and interested and *started*, he is almost sure to continue under these influences all his life. It has been found entirely practicable for a skilful librarian thus to reach and interest people who have never been in the habit of reading; to lead readers into new and more profitable fields, and to create a thirst for better books. In fact the number of ways in which people can be helped is only equalled by the power and lasting character of this influence which comes from good books. Recognizing these facts there are preachers who are looking to the adoption of the library profession as a way to spread the Master's word even more effectively than in the pulpit; and there are teachers whose whole hearts have been given to the cause of popular education, who are eager to enter this newer field, because they recognize in it a still wider opportunity."

Is it not true that the ideal librarian fills a pulpit where there is service every day during all the waking hours, with a large proportion of the community frequently in the congregation? Has he not a school in which the classes graduate only at death?

Much is already done, and while the work is in its infancy, it is an infant so vigorous as to leave no fears of its manhood. A last great step remains to be taken, and to-day and here it ought to be begun. The State long ago recognized its school system as one of its bulwarks, and fosters it with yearly increasing expenditure. Now it must recognize educational libraries as necessary companions of the most successful schools. This eminent body represents the higher education of the Empire State, which the regents of the university are charged with fostering. Tell me if you think they can, without taking action, face our facts that the best reading more than the schools give education to our people; that the colleges provide for only the trifling minority who can afford time and money to share in their great advantages; that the influence conceded to be the

most potent is left without guidance, supervision, stimulus, or support. When inspection shows that a school has attained a certain standard, it is honored by being made a "regents' academy." Can we do less than give similar inspections to libraries, and when one is found doing the high work at which we have glanced to-day, honor it by making it a "regents' library," and by virtue of success in its high calling, a member of this convocation which represents the institutions that give New York its higher education? What greater stimulus can we place before our growing libraries than such certain and official recognition of superior work?

Many advantages are sure to spring from entering wisely on this course. I do not advocate undue haste. The essential thing is to recognize the principle and then meet year by year the growing demand for advice and inspiration. There need be no obligatory supervision. A library secretary would soon have more requests for advice and help than he could well answer. New communities are constantly waking to the need of libraries, and would be deeply grateful for wise advice as to the best means of developing interest, raising money, selecting, cataloguing, and circulating books, and the thousand details which make or mar success. It is well known to the experienced that the same money can be made to do double good under wise administration, and yet for lack of just such help as could be afforded at a cost to the State too trifling to be worth mentioning, many a community either fails to secure its library, or fails to get from it all the good that the time and money could be made to yield.

There are few topics where technical knowledge and experience are so important as in establishing and administering successfully a library of the highest grade in its ideals, even though its income be small and its books comparatively few. It requires no vivid imagination to picture the practical value to the State if any town, about to found a new library or improve an old one, could come to the regents and have, without charge, the best guidance for its case that the combined experience of the library world had yet worked out. Time allows me only to lodge the thought in your minds. No expensive machinery is required. A single salary, with a hearty recognition of the work, would start it creditably.

Such an officer would soon find money and books placed in his hands by those wishing to give them where they would do most good, and recognizing his superior facilities for wisest distribution. The excellent results that have become notable from the regents' school examinations would be duplicated in good effects on library interests by competent inspections, reports, and suggestions to such libraries as wished them. New York's splendid collection, the best owned by any State library, is about being moved into these adjoining rooms, which are admirably adapted for the focus of State library interests and the central people's university. The regent's office is ideally fitted to be the centre of a system of university extension, such as is marking an era in the great English universities, and carrying to all parts of the kingdom the learning of Oxford and Cambridge and the other great schools, and for the first time giving them a practical connection with the lives of the masses, and making them a new and mighty force in working out higher standards of good citizenship. This work naturally centres at local libraries. Fellows and teachers from the colleges go out for a trifling fee, to distant towns, to give courses of ten to twenty lectures on political economy, history, literature, science, or art; indeed, the whole range of the university curriculum is open. With the lectures are given references to the best books to be found in the local libraries, and the common people hear them gladly. Interest is aroused. Many are led to read and learn more than has been told them in the lecture. Those most interested meet for discussion and further instruction, and the practical results have been so much beyond expectation that the universities are allowing work of this kind to be credited as a part of a university course leading to a degree. This means that many a man who would otherwise spend his time idling about saloons, secures instead a higher education worthy the name. Cambridge alone, I am told, has carried on over six hundred of these admirable university extension courses in the past ten years.

Do I hear some one say that New York has tried the scheme of libraries for the State and that it has failed? With that story I am familiar. We have learned by experience what not to do. Every great movement is apt to succeed only through repetitions and failures. The district school system failed because too widely dissipated and because it had no supervision such as I have merely hinted at to-day. Who could expect twelve thousand libraries to be administered successfully in a State where there were not twelve men that could be fairly said to be thoroughly fitted for the work?

The great State of New York led all the rest in recognizing, many years ago, the importance of good reading and in trying to meet the want. Seventeen other States followed its example, and we are proud of our leadership. To-day State after State has left New York behind. More than once in our national library conventions have we of New York been forced to hear her slightly spoken of because she was doing so little modern library work. But no State has yet given recognition to all that this new work implies.

If New York will again rise to the occasion and officially recognize the library as a part of its system of higher education and give to libraries of the highest type as fast as they reach the standards a seat in this convocation as being in fact as well as in resolution co-workers with the colleges and the universities, then again shall she wear her crown of leadership. If she fails, before many more meetings some other State will have seized the opportunity that now is hers.

Gentlemen of the convocation, it is to-day your high privilege to lead. To-morrow it may be your bounden duty to follow.

HIGHER EDUCATION IN THE NORTH-WEST TERRITORY.

BY GEORGE W. KNIGHT, PH. D.,

Professor of History and Political Science in Ohio State University, Columbus, Ohio.

[Read before the American Historical Association, at Washington, December 27, 1883.]

Many of the members of this association have learned with pleasure that the National Bureau of Education, under the direction of the present Commissioner, Col. N. H. R. Dawson, has authorized the preparation and undertaken the publication of a series of monographs upon the history of higher educational work in the United States. This important undertaking, when completed, should be of great value to all who are engaged upon or interested in the growth and progress of American colleges and universities in general, their objects, scope, and success, their relations to and influence upon popular education on the one hand and upon the advance of higher educational ideas and attainments on the other; and finally, the results of these studies should throw much light upon the question, already broad and constantly broadening, of the relations and duties (if such there be) of the Nation and the State, under our democratic form of government, in the control or maintenance, at public expense, of higher educational institutions.

Heartly thanks are due to Commissioner Dawson for this work, and also to Dr. H. B. Adams, who has prepared the first two monographs in the series and who is exercising editorial supervision over the others.

The work in various States has been delegated to different men, and it having fallen to the writer of this paper to prepare the material for some of the States of the old North-West Territory, it is proper to announce that the following paper is of the nature of an essay, introductory to the history of the higher educational development in those States, based upon the writer's investigations and monographs upon the other States of the territory, not yet published, the manuscripts of which he has been permitted to examine.

INTRODUCTORY SKETCH.

It is necessary in entering upon the discussion of a subject having no invariable and universal meaning either at all times or in all places at the same time, that the scope and signification of the subject be indicated at the outset. Higher education is a term of this sort, having a very different signification to-day from that of fifty years ago. Even to-day the term, at least as practically applied, comprehends something quite different at Cambridge, or Baltimore, or Ithaca, or Ann Arbor from that at Hiram, or Battle Creek, or Chaddock, or fifty other places in the country.

Without then attempting to set the exact bounds of the term, for purposes of historical study it is within limits to consider the work of all those institutions calling themselves colleges or universities and conferring the traditional baccalaureate degree or some modern variation, but to study in greatest detail those institutions which have unceasingly striven to embody the true university spirit, and whose strivings and achievements have had a more or less noticeable influence in giving shape and character to the higher education of to-day.

The five States of the North-West Territory present features of exceptional interest and importance in the history, development, and attainments of the American higher education. Not that higher educational facilities have developed more rapidly or advanced ideas have spread faster and more widely than elsewhere in the United States, but that owing to certain facts peculiar, in a considerable degree, to the history of the territory, definite results have been attained and tendencies have been started that are exerting important influences outside the limits of the North-West Territory.

These facts may be briefly indicated:

First.—It was in connection with the organization of this territory that the Congress

of the United States first made grants of land for the endowment of educational institutions both primary and higher. Thus the question immediately rises as to the original design of Congress in making these endowments and the influence and effects of their action upon the development of educational policies.

Second.—The territory contains probably the weakest college in the United States that is classed as a State institution, and is controlled and nominally supported by the State; it also possesses the strongest and most successful university in America that has from the outset been controlled by the State and sustained *solely* by a national grant and the proceeds of State taxation. In consequence a study of the history of the territory should disclose some of the conditions precedent to the establishment and successful maintenance of direct relations between the State and the higher education.

Third.—The territory contains a State which has in operation more colleges than any other member of the Union; while in another State of the territory policy and public sentiment have apparently tended to check the founding of numerous colleges, while they have favored and fostered a few, and notably the State University and State Agricultural College. A study of this phase of the history of the territory ought to assist in answering the oft repeated query whether the progress of the true higher education is in any marked degree dependent upon the number of colleges within a given area of territory.

Fourth.—The territory as a whole—the five States now composing it—show in their history the gradual but steady development of the idea that the interests of the State and of education are conserved by a liberal and hearty support of a State university, controlled by public officers and relying not upon private endowment but upon public grants and appropriations for their income. There has been a slow but marked disappearance of the doctrine of *laissez faire* as applied to higher education and the appearance in its place of the idea of the advisability if not the duty of State support and centralized effort. Not that a State university is to be established and maintained at the expense or detriment of private sectarian or non-sectarian colleges, or with the remotest thought of supplanting them, but that the public education of the youth of a State begun in the common schools scattered throughout the State, continued in the high schools less numerous and for the most part confined to the cities and towns, may properly be completed, for those who desire to avail themselves of it, at a State university equipped for undertaking such collegiate, university, and advanced special and professional instruction as the collective will of the people may direct.

Much of the history of higher education in the North-West was, however, enacted before this idea had received any extensive development or was involved in its development, and the chief preliminary inquiry to be made in an historical study of the subject is, "By what theories and upon what bases have the colleges and universities of the North-West been organized?" The chief purpose of this introductory sketch is to afford a general, and it is hoped satisfactory, answer to that inquiry.

The fact that is apt first to impress the most casual observer of educational matters in the North-West is the existence of a surprisingly large number of colleges in the five States in consideration. The second fact to attract his attention is the unequal distribution of those colleges among the five States. His next discovery, if he continues the examination, will be that in each of the two States that contain far less than their proportionate number of colleges there is a large and strong State university. In order that these facts may be more clearly evident a few statistics must be given here.

There were in operation in the five States of the North-West Territory in 1886, 93 colleges and universities, conferring degrees, including 5 scientific and technical institutions. There were also 26 institutions for the superior instruction of women, the majority of them conferring degrees, making a total of 119 higher educational institutions, not including any strictly professional schools unconnected with colleges or universities proper.

Of the 93 colleges then in operation 1 was in existence in 1810, 2 in 1820, 7 in 1830, 20 in 1840, 33 in 1850, 53 in 1860, 77 in 1870. Of the 26 women's colleges and seminaries 1 was in existence in 1830, 5 in 1840, 11 in 1850, 19 in 1860, 21 in 1870. Many other so-called colleges have been established that after a fitful career have disappeared leaving no traces except a few graduates and considerable indebtedness. In Ohio, for example, 14 universities and 42 colleges were chartered before 1860, of which but 22 are open to-day, showing the death of 34 colleges in that State alone, or more than are living in any other State to-day.

The foregoing statements show, by a little comparison, that the old North-West Territory contains more colleges and universities than are to be found to-day in the thirteen original States of the Union, omitting Georgia and South Carolina, and that if the same ratio according to population obtained as in the eleven original States, the North-West would have but 56 instead of 93 colleges.

Of the 93 colleges 34 are located in Ohio, 16 in Indiana, 25 in Illinois, 10 in Michigan, and 8 in Wisconsin.¹

Of these, 9 are in fact or in name State institutions, more or less closely connected with the State, distributed as follows: Ohio, 3; Indiana, 2; Illinois, 1; Michigan, 2; Wisconsin, 1. Of the remaining 84, 11 are non-sectarian in their organization, of which 7 are located in Ohio, 1 in Indiana, and 3 in Illinois. Seventy-three are under the control or patronage of various denominational or sectarian organizations, as follows: In Ohio, 24; in Indiana, 13; in Illinois, 21; in Michigan, 8, and in Wisconsin, 7. Of the institutions for the higher education of women 7 are non-sectarian and 19 are under the patronage of religious denominations.

Without counting the institutions for the higher education of women Ohio has more colleges and universities than any other State in the Union; Illinois, if she possessed one more college, would rank second, while Indiana holds the seventh place among the States, Michigan twelfth, and Wisconsin sixteenth.

Any adequate interpretation of the history of the higher educational movement in the North-West must explain the causes producing this great diversity in the number of colleges in these States, for it is not accidental nor unimportant. In tracing out such an explanation it will be convenient at the same time to dwell upon the changing relations of the State to higher education, not because the two phenomena are necessarily interdependent (though some may be disposed to consider them as different results of the same set of causes), but because in this way the necessity of twice traversing the field will be avoided.

Down to a point well along in the present century the almost universal belief was that the care of higher educational concerns belonged to and should properly be left in the hands of religious organizations; and the practice corresponded to the belief. Indeed, the recognition of the duty of the State to provide any free and public educational facilities of the lowest type hardly antedated that period in some parts of the country. Ohio was not worse than other States in this regard; yet Ohio, admitted to the Union in 1803, had been a State for twenty years before a tax for common school purposes was authorized; nearly twenty-five years before it was made the duty of the townships to provide schools, and nearly forty years before any State school fund was provided other than that arising from the Congressional land grant. When Ohio was settled a separate department of education in either State or National Government, unless the writer is grossly misinformed, was unknown in American statecraft. As for the higher education there was at that time no college in operation in America directly subject to State control. A few colleges had received gifts of money or land from the legislature of the colony or State in which they were situated, but they were essentially private colleges so far as their management and policy were concerned, and perhaps the majority were under denominational patronage. Washington, Madison, and a few others desired the foundation of a great national university, and Jefferson had begun his long struggle for a State university in Virginia; but the idea was not often advanced, and was less often accepted,

that either Congress or the State should take any active part in the support or control or even regulation of higher education.

The grant of lands by Congress in 1785 and 1787 for the support of common schools and a university in the North-West Territory has often been regarded as a definite and conscious departure from these old educational traditions. This position has never been substantiated. On the contrary, it seems to have been established beyond question by recent investigations that, so far as Congress was concerned, whatever may have been the ultimate aims and hopes of individuals, the grant of two townships to the Ohio Company in 1787 for a university "to be applied to the intended object by the Legislature of the State" did not constitute the deliberate adoption of a policy of "national aid to higher education." It was on the part of Congress merely a business transaction, and there is no evidence that it was considered by any one at that time as a measure likely to be influential in giving shape to the educational policy of Congress or any future State. Neither is there evidence that Parsons or Cutler, when they advocated and obtained this grant, had developed any novel theory as to its future use. Rather, as their ancestors had early laid the foundations of a college at Cambridge, and had obtained assistance from the general court, so here in the "later New England" they desired to plant a local college, and with characteristic shrewdness discovered that its original endowment might easiest be obtained from the national landowner. Through the precedent forced upon the Government by these shrewd New Englanders Congress *drifted* into the policy of endowing a college or seminary of learning in each new State.

It has been assumed or asserted by later generations that, after it had been decided that the grant of lands should be made, it was the well-defined intention of all concerned that the institution eventually receiving the benefit of this endowment should be in a broad sense a State institution closer in its organic relations to the Government and people than a college on a private foundation. Careful investigation has shown this assumption to be erroneous. The idea of State support, regulation, and control of a college or university, involving a wide departure from prevalent theories, was not so suddenly and easily implanted in the West.

The only conditions attached by Congress to the grant of land were (1) as to the location of the grant, and (2) that it should "be applied to the intended object by the Legislature of the State." The grant itself and both these conditions were inserted in the contract at the request of Dr. Manasseh Cutler, the agent of the Ohio Company in the transaction. But for his persistency no grant would have been made for a university at that time. Consequently, his views concerning the nature of the university, if ascertainable, should determine conclusively this important point. His grandson says: "Of all the plans for the future involved in the purchase this one of a university was, perhaps, the favorite with Dr. Cutler." (*Memoirs of Manasseh Cutler*, II, 33.)

Until 1799, twelve years after the contract was made and settlements begun by the Ohio Company, no steps had been taken to organize the university. In the years 1799 and 1800 a correspondence touching the university was carried on between Dr. Cutler, then resident in Massachusetts, he never having removed to the West, and Rufus Putnam, in Marietta. The recently published memoirs of Dr. Cutler contain the entire correspondence, and portions of it had been published previously.

February 3, 1799, Gen. Putnam wrote to Dr. Cutler giving a few suggestions concerning the proposed university, and concluding: "I hope you will give me your opinion, or rather a systemized plan applied to our circumstances and the objects we have in view."¹ July 15 Dr. Cutler responded: "I have attempted to throw my ideas on paper * * * but I have not been able to mature my mind sufficiently to satisfy myself, and am sure I should not be able to satisfy others. * * * So far as I have had opportunity I have consulted the charters of public seminaries in Europe and America. Those in our own country are the most modern and best adapted to the purposes intended."²

August 7, 1779, General Putnam again urged Dr. Cutler to send on his plan, writing as follows: "This request I must again renew, and by a systemized plan, I mean a bill in form of an act, or law, incorporating A. B., C. D., etc., and defining their powers, accompanied by such remarks as you may think proper to make. We are totally destitute of any copy of an incorporating act, or charter of a college, or even an academy; but this is not my principal reason for applying to you. It is a subject I know you have long thought of, therefore I request of you not only the form, but the substance."³

June 30, 1800, Dr. Cutler wrote to Putnam enclosing a "Charter of University" which he had drawn up for the proposed institution, accompanied by a long letter in the nature of a commentary on each of its sections. This charter, which was in form for adoption by the territorial legislature, provided in substance for the creation of a body politic by the style of "The Board of Trustees of the American University," composed of eleven men to be named in the act of incorporation. The power of perpetuating the

¹ *Memoirs of Manasseh Cutler*, II, 19.

² *Ibid.*, 20, 21.

³ *Ibid.*, 21, 22.

board was vested in the trustees; they were given authority to establish a university and to determine and regulate its policy and government; the two townships of land were to be turned over to the corporation, which was to have full power "forever hereafter," to have and rent the lands for the benefit of the university, and to apply the income as the trustees should direct.¹

From the foregoing several things are to be noted: (1) Twelve years after the Congressional grant had been made, the man at whose solicitation it had been given—a man of broad culture and wide information—had not yet determined to his own satisfaction how the university should be organized. (2) His plan when finally completed created merely a private corporation such as would be created for any college, and made it a close corporation. (3) To this corporation he would give full and absolute control over the Congressional grant, save only that the lands should not be deeded in fee by it. (4) The amount of property that might be held by the corporation was to be limited as in most private corporations. (5) No right was to be reserved to the Territory or the State to modify the charter at any future time. (6) In no manner, either directly or indirectly, was there in this plan any specified or implied recognition that the institution when once created was to occupy any different position in the State or relation to the people than that filled by any other private college.

The inevitable conclusion is that in 1787, when the grant was made, the idea of establishing a State university had not been conceived by the projectors of this institution, and that by the clause in the contract that the two townships of land for a university "be applied to the intended object by the Legislature of the State," it was merely intended that the Legislature should hold the lands as a temporary trustee until it should have chartered some university and bestowed the lands upon it, after which the institution should be merely a private corporation, and the duty of the State in the premises should cease.

Two years after Dr. Cutler had drafted and sent on his proposed charter the territorial legislature passed an act establishing a college, and giving to it in trust the two townships. This act of incorporation was in the main the one prepared by Dr. Cutler, but with sundry modifications that radically changed the scheme of its polity. The first trustees were named in the act to serve during good behavior, but their successors were to be chosen by the Legislature of the Territory or State, whenever vacancies occurred. No limit, as in the case of private corporations, was placed on the amount of property that might be held by the corporation. The Legislature specially reserved the power to extend or diminish the powers granted to the trustees, "as shall be judged necessary to promote the best interest and prosperity of the said university."

These changes from the plan of Dr. Cutler, which some writers have thought unimportant, modified *in toto* the legal relation between the State and the college. Instead of becoming one among many private colleges, the institution was from a legal standpoint brought under State supervision. It does not appear, however, that at that time it was contemplated that the State would ever be called upon to assist in sustaining or enlarging the college, or that it would be connected with any public system of education. The naked legal relation was established, and nothing more. Future support and control by the State was made possible; that it was contemplated is hardly probable. Why, and by whose influence the plan of Dr. Cutler was modified, as indicated, does not appear. Should this point be determined it will supply an important link in the historical chain. In its absence it is reasonable to infer, since Dr. Cutler, the chief promoter of the college, contemplated the establishment of an institution subject to private control, and since educational sentiment in the settled parts of the country favored private colleges, in fact, hardly conceived of a college on any other basis, that the Legislature did not intend to found a State university in the sense that that term is employed to-day.

After Ohio became a State, the Legislature passed an act rechartering the university. This act, similar in all important respects to the territorial charter of 1802, changed the name of the institution to Ohio University, located at Athens, and existing to-day as the oldest college in the North-West Territory. Miami University, founded upon another Congressional grant of land within Ohio, was organized a few years later upon a basis similar to that of Ohio University.

While these two institutions were closely related in their legal status to the State, there was no general public sentiment to sustain and make more prominent that legal relation. They were looked upon by the people of the State as mere local colleges, and it is doubtful if their semi-public character was generally understood or known. They appear to have been considered as no better, no worse than other local colleges which soon sprang up.

Ohio, while its first settlers and its organic laws came mainly from New England, soon contained settlements from various parts of the country, and, what is more important in its educational history, embraced adherents of almost every denominational variety of

¹ Memoirs of M. Cutler, II, 22.

Christianity. Accustomed to the prevalent ideas in the East, as the adherents of these various sects became more numerous in Ohio, first one and then another established an academy, a college, and perhaps a theological seminary for the education of its sons, and eventually of its daughters. Each denomination felt that its children should be educated in an institution controlled by its own church or at least not in one controlled by any other sect or by no sect. Religion and higher education having usually gone hand in hand in the older States, it was natural that they should in the new. If there were few colleges in New England, they argued, it was because there were few religious sects. In the broad State in the West, where all nationalities and all shades of religious belief were finding an abiding place, separated as they were from the older colleges of the East, each denomination felt it an imperative duty to establish a college, and of course with it an academy or preparatory school. Local pride, too, often contributed to establish a college in one town because there was one in a neighboring town. Occasionally a non-sectarian college was founded solely in the interest of liberal culture and training, but such were few. The two State colleges which had been established were hardly mentioned outside their immediate localities, and public sentiment, as reflected in the Legislature, entirely neglected them. Indeed, each of these institutions was dominated for a time by a prominent religious sect.

Every student of history has noted how tendencies, prejudices, or modes of action once thoroughly started in a community or a State, continue to exercise a powerful sway long after the reasons for them have disappeared or lost their force. In Ohio, for example, there is still a peculiarly strong and sensitive opposition to any suggestion of bestowing the veto power upon the Governor; simply because the territorial Governor nearly ninety years ago abused that power shortly before the State constitution was framed, and, as a consequence of the temporary anger of the people, the State constitution was framed withholding the veto power from the Governor.

So the theory that the existence of an extremely large number of colleges is essential to the interests of the people and to the cause of higher education, regardless, apparently, of the character, scope, and thoroughness of the institution, has perpetuated itself in Ohio. In that State to-day the law governing the incorporation of colleges is substantially that in force for the last forty years, and under its provisions any five persons may associate themselves, and, by filing with the Secretary of State articles setting forth the name, location, and object of a proposed college or university, shall receive a certificate of incorporation entitling them to all privileges and powers usually exercised by a college. There is no specification or limitation as to the nature of the courses of study or degrees to be granted and no supervision by the educational department of the State. These laws have facilitated the founding of colleges. Have they tended to insure the stability and prosperity of the institutions founded under their provisions?

Extending investigation over the entire territory it is seen that the five States separate themselves into two groups. The southern tier, consisting of Ohio, Indiana, and Illinois, was settled first and the population and institutions of the three States appear to have been mainly of a similar origin. They became States at dates so slightly separated that the same set of causes naturally affected their organization and much of their policy. The northern two, Michigan and Wisconsin, belonged to a later generation; an interval of nearly twenty years elapsing between the admission of Illinois (the last of the southern tier) and Michigan (the first of the northern). Consequently while Michigan and Wisconsin would naturally be dominated by similar sentiments and have similar constitutions and fundamental laws, they with equal naturalness reflect in those institutions the sentiments of a later day than those represented in the institutions of Ohio, Indiana, and Illinois.

Further, the tendency of the streams of migration in this country to follow in a general way the parallels of latitude, had its influence. In Indiana and Illinois the majority of the early settlers who gave shape to the institutions of those States were of the same classes and conditions and possessed of similar ideas with the founders and early settlers of Ohio. There was no sentiment even among the foremost men of those States favorable to or even appreciative of the idea of State universities as a part of the public educational system of an American State. With difficulty were these States at first induced to provide for the maintenance of common schools, and when private corporations were ready and anxious to organize and maintain colleges the desirability or the usefulness of a State university was not perceived. Accordingly in Indiana the territorial legislature in 1806 bestowed the Congressional grant upon a private college at Vincennes, and appear not even to have discussed the establishment of a territorial university. In 1816, when Indiana became a State, another township of land was given by Congress, and a seminary was organized which in 1828 became the College of Indiana, but organized much as the two Ohio institutions had been. Though the subsequent developments of this institution since about 1850 has shown that the true higher educational idea has been grasped and applied, its early career was marked by no events of peculiar and special influence upon the development of the higher education in the North-West.

In Illinois, though the State received a land grant in 1818 for the endowment of a college, the proceeds of the grant were borrowed and used by the State for other purposes until 1857, when they were bestowed upon a normal college or university. At the same time, both in Indiana and Illinois, the freest scope was given by public sentiment and by law for the incorporation and establishment of private colleges, and in Illinois, especially, many were founded under the support of the various denominations, and upon the New England model.

Turning, now, to Michigan, the first settled and admitted of the northern tier in the territory (if two may be considered a tier), a different set of forces is found to have shaped the higher educational policy, and, as a consequence, a somewhat different educational status exists at the present time. In that State was brought to maturity, in its practical application, a theory of the State's relation to the education of its citizens that has exercised a greater influence upon other States than is attributable to even that grand idea of a university for which Thomas Jefferson strove so hard and with such ultimate success, and whose history has been recently told in the scholarly monograph of Dr. H. B. Adams.¹

It is true that general educational ideas had advanced much in the thirty years just preceding Michigan's organization as a State, and that she could take advantage of that progress, but, independently of other American States, she worked out and put in operation something different in an educational way than had existed before.

In 1817, when there were not over 7,000 people in the territory, the first steps were taken to organize the higher educational policy of the territory. In that year, as the result of a conference between Rev. John Monteith, a young Princeton graduate living in Detroit, and Hon. A. B. Woodward, one of the judges of the territorial court, an act was adopted by the Governor and judges of the Territory establishing the Catholepisterniad, or University of Michigan. This act, as redolent throughout as in its title with the pedantry of its author, was drawn by Judge Woodward, and the advanced ideas lying underneath its polyglot covering were in the main inserted by the learned judge; whence he derived them is not altogether determined, but probably many of them, like the unfamiliar Latin and Greek titles of professorships in the act, were original with Judge Woodward, while some were undoubtedly borrowed from France.

By this act the nature of the university was prescribed, and in addition to the university functions proper, the institution was given the right "to establish colleges, academies, schools, libraries, laboratories and other useful literary and scientific institutions throughout the various counties, cities, towns, and other divisions" of Michigan. For its benefit the taxes were increased 15 per cent. In essence, this act subordinated all public education in the territory to the control of the university and made the latter the head of the educational body. It is doubtful if in the whole educational history of the United States more suggestive ideas can be found in any single enactment than in this brief law covering less than two pages of the ordinary statute book. In it lay complete the idea of the duty of the State to undertake the whole educational work from lowest to highest. Under its provisions two professors were appointed, the one a Protestant clergyman, Rev. John Monteith, the other, Gabriel Richard, the Catholic bishop of Michigan. The appointment of two such men is still further evidence of a new departure in educational matters. They proceeded at once to establish primary schools in the three principal settlements in the territory and a college or rather an academy in Detroit. No higher educational work was at that time possible nor attempted, but the all-important idea was planted that a university, even though for a time it exist in name only, was a part of the public educational system and should have direct relation with the primary and secondary education.²

In 1821 the act was superseded by one clothed in nineteenth century English, modifying and recasting the university. The important feature was retained that the trustees in addition to establishing a university "might from time to time establish such colleges, academies, and schools dependent upon the university as they might think proper." The college township granted by Congress was to be placed in the care of the trustees and the schools established under the first organization were turned over to the new one. From 1821 till Michigan became a State this corporation, though it did not establish a college, maintained the academy and schools and kept prominent the idea that a State university was to be established as the cap to the educational pyramid of the State.

When the State constitution was framed in 1835 provision was made for the creation of the office of State superintendent of public instruction. The evidence is clear that this provision was in imitation of the Prussian system; a stray copy of Cousin's famous

¹ Thomas Jefferson and the University of Virginia. By H. B. Adams, Ph. D. (U. S. Bureau of Education, Circular of Information, No. 1, 1888), Washington, 1888.

² For an excellent account of this educational beginning in Michigan see an article on territorial schools in Michigan by Prof. Lucy M. Salmon, in *Education*, volume for 1885. A good account is also given in Ten Brook's History of State Universities and the University of Michigan.

"Report" having a short time before fallen into the hands of the member of the constitutional convention who introduced and advocated the clause creating the office. Rev. John D. Pierce, a native of New Hampshire, a graduate of Brown University, and a resident of Michigan since 1831, was immediately appointed to the office, and among his first duties was that of reporting a plan for the organization of the common school system and a university and its branches. Mr. Pierce was familiar with the history of the territorial university organization and he too had studied Cousin's "Report." As a result, in 1837 he presented a report to the Legislature containing elaborate arguments in favor of the establishment of a university upon a broad basis. He advocated one central university and the establishment of branches in each county and an intimate relation between the university and the educational department of the State. In substance, the Legislature adopted his plans, and the university which for twenty years had existed mainly on paper soon began its actual educational career. While considerable modification has been made in its organization the State has never once wavered from the position that the university was rightly the crown of the public educational system of Michigan. Though the original idea of giving the university control over secondary education was abandoned in 1837, it was in 1870 virtually re-established, when the university announced that thereafter it would admit without examination to its Freshman classes graduates from such public high schools in the State as would adjust their courses to fit the university requirements for admission. As a result the high schools of the State have as a rule met the standard set by the university and respond as quickly to a modification of the university's entrance requirements as if the university government had direct authority to authorize a change in the high school courses.

It has seemed fitting to enter into such details in order to show that the idea of a great State university, controlled and managed by public officials, endowed by the National Government and assisted by State taxation, was a growth in Michigan from causes not common to the three older States, and that by the time Michigan was ready to open her university for students, the theory of State control, and so far as necessary State support, of a university, was accepted as a natural function by her people.

At the same time the general collegiate experience of Michigan has been noteworthy. Comparatively few sectarian colleges have been founded, and their character and scope have placed them in a good rank as compared with similar institutions in the West. It is believed that this has not been the mere result of chance or accident. Superintendent Pierce, at the beginning of the State's career, in his report for 1838, raised the question whether any charters for private colleges should be granted by the State, and himself took a radical position against the issuance of such charters. In discussing the subject he expresses himself forcibly, and as many then thought and will now think intemperately, saying that by the decision of this question by the Legislature it would be determined "whether the State shall eventually assume the first rank in the republic of letters by founding and rearing up an institution of noble stature and just proportions, worthy alike of the State and of learning, and equally worthy the name of university, or whether the State shall ultimately sink to a low level in the world of knowledge, having institutions under the imposing name of colleges scattered throughout the length and breadth of the [land] State, without funds, without cabinets, without apparatus, without libraries, without talents, without character, and without the ability of ever maintaining them. If one is granted others must be, and there is no limit. If one village obtains a charter for a college all others must have the same favor. In proportion as they increase in number, just in that proportion will be their decrease of power to be useful."

The Legislature, in a long and able report of one of its committees, took issue with the superintendent, and refused to adopt his views. Provision was soon made by which colleges might be organized and chartered. The general law of the State for nearly forty years has provided in substance that while any five men may receive a charter as a college corporation, they must first show that stock or legacies to the amount of \$30,000 have been provided, and that fifty per cent. has actually been paid in. The college is then given usual collegiate powers with the right to confer the customary degrees, "provided that the course of study shall be in all respects as thorough and comprehensive as is usually pursued in similar institutions in the United States." The college must make annual reports to the superintendent of public instruction on certain specified matters that will give him a knowledge of their condition and work. Further, the superintendent annually appoints a board of visitors for each of these private colleges, and this board must submit to him an official report of their examination, which report is published by the State.

From the foregoing it is to be noted that while the establishment of colleges has been provided for and in no way discouraged, all such institutions have been made in a reasonable degree subject to State regulations and to public and official visitation. That these provisions have had a wholesome influence upon the character, scope, and development of the colleges in Michigan can hardly be questioned.

Wisconsin modelled her university and her entire educational system upon that of Michi-

gan, and if the development of her State university has not been so marked as in the case of Michigan, it is mainly due to the fact that it is younger. Indiana has for some years been working along the same line of development, and Ohio and Illinois have so far modified their earlier policy as to take advantage of the land grant of 1862 for agricultural colleges, and by a somewhat broad interpretation of the provisions of the grant have founded each a university upon a broad and liberal basis.

To conclude in a few words, the history of the higher educational movement in the North-West shows the foundation, especially in the older States, of many private colleges, each of which in its own field is doing higher educational work. Along with the establishment of these colleges has come the development and spread of the State university idea, not as antagonistic to the private colleges, but as co-operative with or supplementary to them, and as rounding out the public school system, which obtains in all the States in the territory. The value of a strong central university, with numerous departments, ample libraries, laboratories, and scientific apparatus, and facilities for post graduate and professional study has been steadily gaining appreciation, not only for the immediate educational opportunities afforded, but for its regulative influence upon the character and scope of the secondary education, and its indirect influence upon the life and culture of the people under a democratic form of government, where public safety demands the education of its citizens.

TRIBAL AND FAMILY RELATIONS AMONG THE INDIANS OF METLAKAHTLA.

In the Report of this Office for 1886-87 a brief account was given of a trip made by the Commissioner to Alaska and of the tour of inspection made in July, 1887, in obedience to the direction of the Secretary of the Interior, to see that the orders of June 15 in relation to the schools in that Territory were being complied with.

Upon that visit it was the good fortune of the Commissioner to meet with the English missionary, William Duncan, and to be present on the occasion when the Indians with whom his life has been spent, having removed from the British possessions to American soil, made a formal opening under the American flag of the settlement, named Metlakahltla, after their former home. The following letter from Mr. Duncan, recently received in response to enquiries respecting the meaning of certain carvings upon silver spoons made by a native Metlakahltan silversmith, contains matters of such general interest in relation to the tribal and family customs and relationships of these Indians, who have now become dwellers on American soil and whose children are to be taught in American schools, that it has been deemed advisable to insert it here:

ON BOARD THE "GEO. W. ELDER,"
July 15, 1889.

Hon. N. H. R. DAWSON, Washington, D. C.:

DEAR SIR: I am glad to learn from your letter of the 28th March that the silver spoons made by our native artist are appreciated.

In answer to your enquiries respecting the maker and his craft, I beg to inform you that he belongs to the Tsim-she-an nation, and his name was Tsah-am-sheg-ish, or the Power-that-draws-shoreward. On becoming a Christian some years ago he was named Abel Faber.

In making the tea-spoons Abel tells me he beats each one out of a silver dollar, but for dessert-spoons, which require a dollar and a half, he has to melt the silver in a crucible. After hammering the piece of silver to the required length and thickness he then forms the bowl of the spoon by beating the plate into a wooden mould of the size and shape he wishes the spoon to be. This done, he files and sand-papers his work (in olden times the dried skin of the dog-fish answered for sand-paper), after which he uses a smoothing-stone, and finally polishes with a handful of soft fibre—the dried and teased inner rind of cedar bark. His last operation is to carve the handle.

The designs he cut on the spoons sent you are peculiar to the carving and painting of the Indians all over the country, and are symbolical of the various crests, or totems as they are sometimes called, which seem to have been adopted in remote ages to distinguish the four social clans into which each band is subdivided.

The names of these four clans in the Tsim-she-an language are Kish-poot-wadda, Canada, Lache-boo, and Lachsh-keak. The *Kish-poot-wadda*, which are by far the most numerous clan hereabouts, are represented symbolically by the fin-back whale (in the sea), the grizzly bear (on land), the grouse (in the air), and the sun and stars (in the heavens).

The *Canada* symbols are the frog, the raven, the star-fish, and the bull-head.

The Lache-boo take the wolf, the heron, and the grizzly bear for their totems; and the *Lachsh-keak* the eagle, the beaver, and the halibut. The creatures I have just named are, however, only regarded as the visible representatives of the powerful and mystical beings or genii of Indian mythology; and as all of one group are said to be of the same kindred so all the members of the same clan whose heraldic symbols are the same are counted as blood relations. Strange to say this relationship holds good should the persons belong to different or even hostile tribes, speak a totally different language, or be located thousands of miles apart.

On being asked to explain how this relationship originated, or why it is perpetuated in the face of so many obliterating circumstances, the natives point back to a remote age when their ancestors lived in a beautiful land, and where, in a mysterious manner, the mythical creatures whose symbols they retain revealed themselves to the heads of the families of that day. Then they relate the traditional story of an overwhelming flood which came and submerged the good land and spread death and destruction all around. Those of the ancients who escaped in canoes were drifted about and scattered in every direction on the face of the waters, and where they found themselves after the flood had subsided there they located and formed new tribal associations. Thus it was that persons related by blood became widely severed from each other, nevertheless they retained and clung to the symbols which had distinguished them and their respective families before the flood, and all succeeding generations have in this particular sacredly followed suit. Hence it is the crests continue to mark the offspring of the original founders of each family.

As it may interest you to know to what practical-uses the natives apply their crests, I will enumerate those which have come under my own notice.

1st. As I have previously mentioned, crests subdivide tribes into social clans, and a union of crests is a closer bond than a tribal union.

2d. It is the ambition of all leading members of each clan in the several tribes to represent by carving or painting their heraldic symbols on all their belongings, not even omitting their ordinary household utensils, as spoons and dishes, etc.; and on the death of the head of a family a totem pole is erected in the front of his house by his successor on which is carved more or less elaborately the symbolic creatures of his clan as they appear in one of their mythological tales or legends.

3d. The crests define the boundaries of consanguinity, and persons of the same crests are forbidden to intermarry; that is, a frog may not marry a frog, nor a whale marry a whale, but a frog may marry a wolf, and a whale may marry an eagle.

Among some of the Alaskan tribes I am told the marriage restrictions are still further narrowed, and persons of different crests may not intermarry if the creatures of their respective clans have the same instincts; thus a Canadna may not marry a *Lachsh-keak*, because the raven of the one crest and the eagle of the other seek and devour the same kind of food. Again, the *Kish-poot-wadda* may not marry a *Lache-boo*, because the grizzly bear and the wolf representing these crests are both carnivorous.

4th. All the children take the mother's crest, and are incorporated as members of the mother's family, nor do they designate or regard their father's family as their relations.

A man's heir and successor, therefore, is not his own son, but his sister's son. And in the case of a woman being married into a distant tribe away from her relations her children when grown up will leave her and their father and go to the mother's tribe and take their respective positions in the mother's family.

This case accounts for the great interest which natives take in their nephews and neices, and which seems to be quite equal to the interest they take in their own children.

5th. The clan relationship also regulates all feasting. A native never invites the members of his own crest to a feast. They being regarded as his relations are always welcome as his guests, but at feasts, which are given only for display, so far from being partakers of the bounty all the clansmen within a reasonable distance are expected to contribute of their means and render their services gratuitously to make the feast a grand success. In the fame of the feast hangs the honor of the clan.

6th. What I have just written reminds me to add that this social brotherhood has a great deal to do with promoting hospitality among the Indians, a matter of immense importance in a country where there are no hotels or restaurants.

All a stranger with or without his family in visiting an Indian village has to do to find shelter and protection is to make for the house belonging to one of his crest, and which he can easily distinguish by the totem-pole in front of it. There he is sure of a welcome and of the best the host can afford, and there he is accosted as a brother and treated and trusted as such.

7th. I may mention, too, that the subdivision of the band into these social clans accounts in a measure for the number of petty chiefs existing in each tribe, as each clan can boast of its head, and the more property a clan can accumulate and give away to rival clans the greater number of head men it may have.

8th. Another prominent use made by the natives of their heraldic symbols is that they

can take names from them for their children. For instance, the name *Weenayach* means big fin back (whale); *Leetamlachtoro*, sitting on the ice (eagle); *Ikshksumatjal*, the first speaker (raven); *Ahil-ka-kout*, the howler abroad (wolf).

9th. And last but not least, the kinship claimed and maintained in each tribe through these crests has much to do in preventing bloodshed, and also in restoring peace where quarreling and fighting have arisen. Tribes and sections of tribes may and do fight, but members of the same crest may not fight; hence in hostilities arising between two or more tribes there are always some families who are non-combatant, and these will watch for the opportunity to interpose their good offices in the interests of peace.

In writing of these matters it must be understood I have kept in view the natives in their primitive state. The Metlakahtlans, who are civilized, while retaining their crest distinctions and upholding the good and salutary regulations and customs connected therewith, have dropped all the baneful and heathenish rivalry with which their clannish system was intimately associated.

Though I cannot say that the foregoing by any means exhausts all that can be said or written on this subject, yet I trust that what I have written will in some degree answer the enquiries you made of me.

I have the honor to be, dear sir, yours, very obediently,

W. DUNCAN.

CHAPTER XXI.

STATE TEACHERS' READING CIRCLES.¹

CONTENTS—*Necessity of discriminating between Books—Negative action in the Council of Education as to the better professional books—The course of the reading circle not confined to professional topics—Lack of enthusiasm in California—Improvements effected in Illinois—Form of certificate and diploma used there—Two-book system also adopted in Indiana—"Outlines" prepared for the works of the Indiana course—The Young People's Reading Circle of Indiana—Backward condition of the Iowa Circle—Reorganization of the Kansas Circle—The recently founded Maryland Circle, and "outline" of one of the works adopted—The recently organized Mississippi Circle—College graduates and poor teachers have no use for the reading circle—Necessity of State recognition—Business forms used in Ohio—The course in Rhode Island, and the reasons for adopting each of the works of which it consists—No State organization in West Virginia—Elections and overwork preventing good results in Wisconsin.*

One of the most desirable associations for the teacher to form, said a schoolmaster at a recent teachers' meeting, is the association of the teacher with one good book and then with another good book; the object of the reading circle is to promote this association and to conduct it in an intelligent way. When the unsuccessful warfare, maintained by the Latin civilization against Teutonic and other invading barbarians, had culled for posterity the more important works of antiquity from the vast literature of the Roman empire, vast notwithstanding the slave or serf did the work of the printing press, science might well be contained in Aristotle and "methods" of education in Quintilian, and there was little demand for a "best hundred books." But literature has again assumed immense proportions, and the question *what to read* is as important as *how to read*, and together they form a very important question indeed.

A report on "Books on Pedagogy" was presented by the committee on educational literature of the National Council of Education, at its last meeting. The subject, however, is treated in a negative rather than a positive manner, and the difficulties of making a selection signalled rather than solved. The remark of the late president of the normal school section of the National Association is more hopeful, when he inquires if it is not desirable that teachers, inasmuch as they follow some kind of authority, should know a little more definitely what the more intelligent and more experienced part of the profession recognize as wisest and best.²

Professional reading, however, is not the only intellectual diet of these circles. The domain of belles lettres is also entered. Yet it is apparent that whatever may be the character of the reading course pursued, the unique object is to improve the teacher as a teacher. To this must be added the influence, powerful, though indirect, in stimulating the formation of public libraries; as is instanced by recent action in a western State.

The inception and administration of these circles is referred to in a general way in the preceding Report of this Bureau. Desirous of obtaining the latest possible information as to the status of these societies, special inquiries have been made in the matter, of each State superintendent of public instruction, or equivalent official. The responses to these inquiries have been used in compiling the following information.

ALABAMA.

"I do not think much is being done," says Superintendent Palmer. The gentlemen to whom he kindly referred us have as yet failed to respond.

CALIFORNIA.

Not more encouraging, but fuller, our information for this State covers the whole of 1888.

Purpose.—"An aid and stimulus to the teachers of California in their efforts for professional improvement and self-culture. The latter must necessarily lead to the former, while the former will continually call for a widening of the mental horizon. It is be-

¹This chapter would have followed the chapter upon the Training of Teachers, had its preparation not been delayed by unavoidable circumstances.

²See training of teachers, p. 395.

lieved that an organization like the one proposed will give that strength which comes from unity of purpose and effort, and make the reading circle an intellectual power in the State."

Course.—The plan of study contemplates a three years' course. For 1887, the initial year, the course was in the following works.

Ben Hur; Payne's Lectures on Education; Trench on the Study of Words, Supplee's edition; Lady of the Lake, Lovell edition, with full notes, paper; Ruskin, Sesame and Lilies.

For 1888 two courses were offered, respectively styled, regular and supplementary. The reading of the regular course is grouped as—

Biography—Plutarch's Pericles, Fabius Maximus, Demosthenes and Cicero, Cæsar and Alexander. Literature—Odyssey, Butcher and Lang's translation. Professional—Hopkins's Outline Study of Man. Literary and Historical—Burke's Speeches on America.

The supplementary course comprised Studies in Longfellow; Pryde's Highways of Literature; Parker's Talks on Teaching; Fiske's redaction of Irving's Washington.

Administration.—The general management of the circle is vested in the State board of councillors, which consists of seven members including the State superintendent of public instruction, who is an *ex-officio* member. The officers are a president and a secretary and treasurer. The terms of two of the members expire each year and are filled at the annual meeting held in December.

County superintendents are urged to form county circles. These are to be directed by a board of four directors chosen by the members of the local circle from among themselves with the county superintendent, as a member *ex officio*. This board, it appears, is subject to confirmation by the board of State councillors. The local board elects its own officers, collects dues, etc.

The annual fee charged is 50 cents; of this 35 cents are forwarded to the secretary of the State circle to defray printing expenses, the remaining part of the annual fee being retained "by the local secretary." Individual members, that is those belonging to the State but not to a county circle, remit the whole amount to the secretary of the State circle.

The State board sends blanks to the local organizations quarterly; upon these the county officers enter the amount of work done and its quality as ascertained by examinations. To those who have completed in a satisfactory manner the annual course of reading the State board issues a certificate and three of these certificates entitle the holder to a diploma of honor. The reading books are furnished by the State secretary, postpaid, on receipt of price.

During the first year of its existence (1887) the membership of the circle was 473, twenty-two counties being represented; in 1888 but fifteen counties are represented and the membership but 322. The blanks sent out early in 1888, requesting information as to the work done in 1887 were, with three exceptions, ignored. The status of the work is well put by the general secretary, Mrs. Fisher, and we quote from a recent letter from her:

"This fact [the general inattention to the request for information], added to the decrease of membership, does not afford a flattering outlook. The successful maintenance of such an organization demands a great amount of earnest, united, judicious, persevering work, not from two or three or half a dozen individuals, but from *many*. This has not been secured in the past. Personally, I am not sanguine as to its attainment in the future. I hope I am mistaken in my views."

COLORADO.

Says the State superintendent: "We have no reading circle for teachers in this State."

CONNECTICUT.

We understand that the public school systems of Bridgeport and Norwich are connected with a branch of the Chautauqua Reading Circle, intended especially for teachers.

DELAWARE.

"There are no teachers' reading-circles in Delaware, so far as I can learn," says the president of the board of education.

FLORIDA.

"We have not organized a State circle as yet," says the State superintendent. "We are just beginning to move in that direction. Our teachers have for some time been associated in Chautauqua circles, which seem to have so delighted them that they are loth to engage in others; but I have reason to believe that in a short time teachers' reading circles will be universal in our State."

GEORGIA.

"As far as teachers' reading circles are concerned, we are unable to give you definite information. The movement in question has not taken general hold of the teachers in this State." This, by the courtesy of Mr. Edgar Orr, of the State department of education.

ILLINOIS.

The Bureau is indebted to Superintendent Gastman, of Decatur, for the very full statement of the affairs of the Illinois Circle, over which he presides.

Purpose.—The reading circle seeks to interest teachers in a carefully prepared course of reading, to the end that they be better prepared to do the important work of the school-room. This must be largely an individual work. It appeals directly to the teachers of the district schools because they can do the work alone just as well as the teachers of the graded schools. A circle of two, five, or ten earnest readers will undoubtedly prove an inspiration and a help, but no teacher who really desires to improve need wait for this.

Any teacher or other person in the State of Illinois may become a member of this circle by forwarding his name to the board of managers of his county together with a pledge to faithfully pursue the prescribed course of study, and paying a fee of 25 cents for this year, and for future years such fees as may be decided upon at the beginning of the year. The form of application for membership is this:

[Blank No.1.]

ILLINOIS TEACHERS' READING CIRCLE.

I wish to be enrolled as a member of the Illinois Teachers' Reading Circle for the year beginning September 1, 1888.

I respectfully request our county superintendent to order the necessary books for me.

_____, 1888.

P. O.

Course.—It has been thought best by the management of the circle that the work be arranged in two courses, the first to be known as the elementary course, and to cover two years of study, and the second to be known as the advanced course, and to cover three years. Since the organization of the circle the following courses have been pursued:

FIRST YEAR—1885-6.

REQUIRED.

TEXT BOOKS.

1. PEDAGOGY.....Hewett.
2. SCHOOL LAW.....Illinois School Law.
3. PHYSIOLOGY.....Any Standard School Text Book.
4. HISTORY.....Barnes's General History, to page 313.

RECOMMENDED READING.

Nordhoff's Politics for Young Americans.

Gow's Morals and Manners.

SECOND YEAR—1886-7.

REQUIRED.

TEXT BOOKS.

1. PEDAGOGY.....Joseph Payne's Lectures.
2. HISTORY.....Barnes's General History, from page 313 through.
3. LITERATURE.....Julius Caesar, Lady of the Lake, and Evangeline.

RECOMMENDED READING.

Parker's Talks on Teaching.

THIRD YEAR—1887-8.

White's Pedagogy.

Barnes's General History.

FOURTH YEAR—1888-9.

History of Pedagogy.—Compayré.

Washington and His Country.—Irving.

At a meeting of the directors, held in Chicago at the time of the National Educational Association, July, 1887, the manager, E. A. Gastman, reported that, in his opinion, it would be wise to abolish the board of county managers and to place the interests of the circle in each county in the hands of the superintendent and teachers; also, that it would be well to discontinue the elementary and advanced courses heretofore outlined, and to arrange, each year, a two-book course for the circle. The directors adopted both recommendations and ordered that White's *Pedagogy* and Barnes's *General History* be used the coming year.

The following circular was issued August 1, 1887:

"To the Teachers of Illinois:

"The experience of the past two years seems to indicate that it will be well to simplify the organization and course of study of the Illinois Teachers' Reading Circle. The organization in each county will be left to the superintendent and teachers to arrange and carry forward. The membership fee will remain 25 cents, as heretofore.

"The board of directors has concluded to prepare a course of reading for each year, and respectfully announce the following for the year beginning September 1, 1887: White's *Pedagogy*; Barnes's *General History*.

"Mr. Geo. P. Brown, of the Illinois School Journal, has kindly consented to prepare and publish outlines of these readings in the Journal, and also in the form of slips, which will be furnished to all readers who may apply to him or to the undersigned. In these outlines an attempt will be made not only to indicate the important topics of the designated books, but to call attention to other books bearing upon these questions, thus making the outlines a guide to the literature of the subjects treated."

The directors earnestly advise all readers to begin with the course of 1888-89. It is no slight advantage to the reader to feel that he is associated with a large body of earnest workers in the same cause. But in response to a number of requests it has been determined to allow readers to select the work of such years as may seem best adapted to their wants. In making selections the reader is requested to note carefully the following:

1. A membership fee of 25 cents will be required for each year except the present.
2. No outlines can be furnished for past years.
3. When asking for the examination questions he must state explicitly which year's work he has completed.

The results of this change will be given hereafter.

In the first annual examination, that of 1886, members were examined on four topics, being asked in all about fifty questions, nearly equally divided among the three subjects of pedagogy, general history (that of Greece and Rome), and school law, but one question being asked on physiology. The members were requested at this examination to answer briefly and were at liberty to consult such works as each might desire. The examination paper for the second year, the second of the elementary course, has about the same number of questions as the paper of the preceding year, also equally distributed among three topics, but not the same three; for poetry has taken the place of school law, and physiology has disappeared. The paper for 1888 is given in full. It bears the title "Illinois Teachers' Reading Circle, Third Annual Report of Readings," and the injunction, "Members will please answer all questions briefly and in their own language."

The questions were—

ON PEDAGOGY.

Have you read carefully all of White's *Pedagogy*, as prescribed? What is the difference between the ideal function of the public school, abstractly considered, and the ideal function of any specific school you may be called upon to teach? Give in your own language your conception of what knowledge, power, and skill are. What are the three faculties of the intellect? Describe the different kinds of knowledge given by each. Define *attention* and *retention* in your own language. Distinguish between *reproductive* and the *constructive* imagination. Distinguish between the process of generalizing and that of classifying. Distinguish between a judgment and a syllogism. Describe the process of forming a general notion, or concept. Distinguish between elementary and scientific knowledge in your own language. What is the truth in the maxim, "Never present the word until the idea has been taught?" What is true in the maxim, "Learn to do by doing?" Why is oral teaching so much easier for a child to understand than *written* teaching? Is it, therefore, better? How many general methods are there of imparting instruction? Name the chief ways of pursuing any one or all of these methods.

GENERAL HISTORY.

Have you carefully read all of Barnes's *General History* and the outlines as required? What books suggested as collateral reading in the outlines have you read? State the

commanding principle of the Chinese, the Indians, the Persians. What was the dominant idea that controlled in the development of the civilization of Egypt? Show how this appeared in their art. Show that the geography of Greece was favorable to a more advanced civilization than had before existed. What were the three great periods of conflict of Greece, or the West, with Asia, or the East? State result in each case. What decisive battles of the world were fought on Grecian soil? Why decisive battles? Name the greatest artists, poets, philosophers, and statesmen of the age of Pericles. Give date of this age. What education was provided for children by the Greeks? How did the Spartan civilization differ from the Athenian? How did Grecian art differ from Egyptian? What would you state as the governing principle or principles of the Greeks? What made Rome a greater nation, in a political sense, than Greece? What was the "Magna Charta" of the Roman people, and how secured? What would you state as the commanding idea of the Roman people? In what did the commanding idea of Christianity differ politically from that of the Romans? What event prevented the degeneration of Christianity in the world to the level of Christianity in the Byzantine Empire? Name the greatest statesmen, poets, historians, and warriors of the Roman people. What was the cause and results of the Crusades? What was the Feudal system? It was a reaction against what, and to what did it lead?

GENERAL.

What other books have you read during the year? What magazines? What educational journals? Have you paid the membership fee for the year? Your name in full. Post-office. County. Illinois.

"The Circle," says the management in a recent address to the members, "is in excellent condition at this date. In many counties a large number of the teachers have been enrolled for this year. Requests for circulars and examination papers are received daily at the central office. Copies of the questions prepared upon the reading of either of the past three years *can still be furnished*. You will receive credit for work done *when ever* you send in your answers. The questions on the readings of the present year (1888-9) will be ready by April 1, 1889.

"The diplomas are ready for those who have completed the work of any *two* years. The general manager is sending out the seals to those who have finished the work of three years.

"The same arrangement regarding certificates and diplomas will be continued; that is, a certificate will be given on the completion of the work of the first year and a diploma when the readings of two years have been finished. For each year's reading, in addition to these, a seal will be furnished, which can be attached to the diploma given at the end of the second year."

The certificate, seal, and diploma are in the following words:

(Certificate.)

ILLINOIS TEACHERS' READING CIRCLE,
Decatur, Ill., —, 188-.

This will certify that ——— has passed a satisfactory examination in the readings of the first year of the elementary course.

E. A. GASTMAN,
Manager.

(Seal:) Illinois Teachers' Reading Circle. Three years. 1888.

(Diploma.)

ILLINOIS TEACHERS' READING CIRCLE DIPLOMA.

This is to certify that ——— has completed the elementary course of readings prescribed by the board of directors of the Illinois Teachers' Reading Circle, and having passed the required examinations is entitled to this diploma.

Witness our signatures:

Given at Decatur, in the county of Macon, State of Illinois, this — day of —, A. D. 188-.

[STATE SEAL.]

E. A. GASTMAN,
Manager.

GEORGE I. TALBOT,
President Board of Directors.
JAMES C. BURNS,
Secretary Board of Directors.

Administration.—The officers for the State at large are a general manager and a board of directors of six. The board holds meetings at such times as the occasion demands, sends examination questions to county managers, and issues a certificate when any year's work has been completed by an examination, and a diploma when the work of a

course has been completed in like manner. In order to save expense the manager of the central office issues all necessary blanks for the use of secretaries of boards of county managers and local circles.

In the counties there was until 1887 a board of county managers, of which the county superintendent acted as president. The four other members were appointed by the State board of directors. If the county superintendent declined the directors appointed a president. The board elected a secretary. The president presided at the meetings of managers.

The duties of the secretary of the county were as follows: 1. To keep a list of members; file pledges of members; report names of new members quarterly to central office. 2. To keep an accurate account of all moneys received and paid out. 3. Give notice of meetings of the managers and of annual examinations. 4. To make, in connection with the president, arrangements for holding annual examination, grading of papers, and forwarding them to central office. The board retained ten cents of each membership fee for their expenses.

Local circles were organized and had a secretary, whose duties were as follows: 1. To report promptly to secretary of county managers the name of the circle, the names of members, and to remit the membership fees. 2. To distribute all circulars, notices, etc., to members. 3. To give notice of extra meetings, and generally to do whatever may promote the efficiency of the circle. The directors suggested that in their judgment meetings should be held at least once every two weeks, and that these meetings should be made as helpful as possible to the members. Local management, however, is now differently conducted, as appears in the following.

"The board of directors," says the address to the teachers of Illinois, "has determined to divide the State into districts, and each director will assist the general manager in organizing and carrying on the work in his own section."

For the year beginning September, 1888, no membership fee was charged. The receipts from all sources principally, we believe, as membership fees were for 1885 and 1886, \$555.73; the financial concerns for these two years are as follows:

E. A. Gastman, treasurer, to Illinois Teachers' Reading Circle.

Dr.		Cr.	
Dec. 30, 1884, to P. R. Walker, treasurer Illinois Teachers' Association.....	\$100 00	By printing, for two years.....	\$174 05
Dec. 27, 1886, to receipts from all sources from Jan. 1, 1885, to Dec. 27, 1887.....	585 73	By clerk hire of manager.....	32 15
		By stationery.....	45 65
		By expense of directors' meetings.....	36 75
		By returned to G. D. Thompson, Gol- conda.....	2 10
Total.....	685 73	By postage, telegrams, and expressage..	93 38
		By salary of manager.....	157 60
		Total	541 68
		By balance on hand.....	144 05

Such is the frame work of the Illinois Circle, and it only remains to inquire if it is animated by the vitalizing principle that Mrs. Fisher laments the absence of in California. From what has already been said on the late reorganization it may be inferred that the condition of the work was not all that was desirable but from what follows it will be seen that the change has been productive of much good. We quote from Manager Gastman's letter to us as to the results as follows:

"The results of this action were very gratifying. At the meeting of the Teachers' Association in December, 1887, the manager was able to report the circle in a flourishing condition, and he attributed this to the aid of the directors in their several districts, to George P. Brown, for preparation and publication of the monthly outlines in the Illinois School Journal, and, lastly, to the shortening of the course so as to require the reading of but two books.

"At the meeting of the Illinois Teachers' Association held in Springfield, December 26-8, 1888, the manager, E. A. Gastman, Decatur, reported that for the year ending September 1, 1889, over two thousand teachers would read the course prescribed, and he estimated that five thousand persons were now doing some part of the work; and stated that the circle was not only out of debt, but had a balance of \$116 on hand.

"By an almost unanimous vote, the association requested the directors to organize a pupils' reading circle. The directors selected the following books for the teachers' circle for the year 1889-90:

"Theory and Practice of Teaching, Page.

"Lectures on Pedagogy, Compayré.

"Lights of Two Centuries, E. E. Hale.

"Teachers were recommended to read the Week's Current, published by E. O. Vaile, Oak Park, Ill.

"It will be noticed that two books are offered in the above course. This was done for the purpose of adapting the work to the wants of the teachers. Those who have read the courses for the past three or four years are *advised* to read Compayró's Lectures on Pedagogy, but this is not required. All others will read Page.

"A pupils' reading circle, of two grades, was arranged, and the following books were adopted:

Intermediate grade, or fourth and fifth readers:

	<i>Cost to pupil.</i>
Sea-side and Way-side.....	45 cents.
Stories of Our Country.....	45 cents.
Advanced grade, or above fifth reader:	
Health Lessons.....	55 cents.
Animal Memoirs.....	60 cents.
The Pathfinders.....	60 cents.

PRESENT OFFICERS.

Directors.—H. D. Fisk, Dwight; James C. Burns, Monmouth; J. A. Mercer, Peoria; John A. Miller, Bloomington; Miss S. May Campbell, Hennepin; George Harrington, Carlinville.

President.—H. D. Fisk.

Secretary.—James C. Burns.

Manager and treasurer.—E. A. Gastman.

INDIANA.

As in the instance of Illinois, so in this, the Bureau has been favored with a very comprehensive report, kindly furnished by the secretary, Mr. D.M. Geeting. Of the two State circles of Indiana, one for teachers and the other for pupils, that for adults claims attention first.

Purpose.—The circle owes its existence to the following resolution adopted at the annual meeting of the State Teachers' Association of 1883:

"Resolved, 1. That this association proceed at once to take the necessary steps to inaugurate an organization among the teachers of Indiana for reading and study, to be known as the 'Indiana Teachers' Reading Circle.'

"2. That the circle be under the care and direction of the Indiana State Teachers' Association.

"3. That this association proceed to choose a board of directors, to which shall be intrusted the selection of a course of professional and literary reading, the issuing of certificates of progress, and the granting of diplomas as evidence of its completion."

"This organization," says the circular, "has resulted in a membership exceeding seven thousand. Well directed, methodical reading can but result in permanent good. The reading circle work insures to every member who carefully and thoughtfully pursues the course a growth in his literary and professional ability. Originating in a generous and laudable desire to furnish suggestions and help to those lacking in opportunity and means, the growth and the success of the enterprise can but gratify the originators of the work."

Course.—For the first four years of the existence of the circle the course was, respectively, as follows:

First year.—Brooks' Mental Science, Barnes' General History, Parker's Talks on Teaching.

Second year.—Brooks' Mental Science, Smith's English Literature, Hewett's Pedagogy.

Third year.—Hailmann's Lectures on Education, Green's History of the English People, and Watts on the Mind.

Fourth year.—The Lights of Two Centuries and Sully's Teachers' Hand-Book of Psychology.

"At the suggestion of county superintendents, to whom the organization owes so much," says Mr. Geeting, "and to whose earnest co-operation is due its large membership, and in harmony with a widely prevailing sentiment among teachers, the course of the year 1887-88 was made to include but two books, while still maintaining the two lines of work originally laid out,—Sully's Hand-Book of Psychology and the Lights of Two Centuries. The popularity of these two books had much to do with increasing the membership. The first gave system and definiteness to professional studies, the latter breadth of knowledge and a large insight into the agencies of general culture."

The fourth annual examination was held in fifty-one counties June 16, 1888, with the following list of questions. Applicants could elect whether they would pass upon any one or more of the four years work. The paper for 1888 is here given.

QUESTIONS FOR EXAMINATION

OF

MEMBERS OF THE INDIANA TEACHERS' READING CIRCLE.

FOURTH YEAR'S WORK—JUNE 16, 1888.

RULES FOR THE EXAMINATION.—In view of the fact that these manuscripts are to be sent to the several members of the board for gradation it is necessary that these rules be followed:

1. Write upon one side of the paper *only*, using legal cap.
2. See that the answers to the questions in each branch are entirely separate from those of any other branch and securely fastened together.
3. Write *full* name and post-office address upon each set of answers.

THE LIGHTS OF TWO CENTURIES.

[Answer any seven.]

1. What is the scope of the work? Of what educational value is it to be considered?
2. Name the parts into which the work is divided.
3. Designate one of the leaders of each class and characterize him briefly.
4. What is the rank of Watteau? Why?
5. Give a short sketch of Turner. What connection has Ruskin with Turner?
6. Who is Boswell?
7. What is Wagner's idea as to the purpose of music?
8. Name two novelists. Two essayists. Describe the home of each.
9. Name five poets in order of your preference, and a work of each based upon your classification.
10. What effect has the development of art had upon civilization?
11. How is the poetry of Wordsworth different from that of the school of Pope?
12. Name five inventors and an invention of each.
13. Which invention do you consider of most value? Why?
14. What noted literary persons were associates of Reynolds? Why were Reynolds's paintings not durable?

SULLY'S HAND-BOOK OF PSYCHOLOGY, 1888.

[Any seven.]

1. Distinguish between the science and art of education.
2. In what respect may the science of education underlie the art?
3. Define these educational terms: *Training, information, instruction, education.*
4. How does the mind acquire *sense knowledge, thought knowledge?*
5. Define self-consciousness and self-activity as fundamental qualities of mind.
6. What is the educational value of memory? Give brief synopsis of "culture of memory."
7. Describe the subjective method of mind study; the objective method.
8. What is attention? What relation does it bear to intellectual operations?
9. State the order in which the mental faculties develop.
10. Name the higher sentiments and discuss their bearing upon the education of the individual.
11. How are concepts formed?
12. Give the author's suggestion as to the proper use of words and the effect upon the child's mental development.

The number taking the examination for 1888 was 178, and over 500 papers were submitted. The number examined and the papers submitted were distributed thus:

On the Course for—	Applicants.	Papers.
1884-5.....	83	264
1885-6.....	134	301
1886-7.....	123	344
1887-8.....	178	556

Of this number 36 took the entire course, and in accordance with the provisions of the organization have received their diplomas, signed by the officers of the board.

Familiarity with the organization forces the conclusion upon the management that it is becoming daily more and more a veritable school for hundreds of teachers who would otherwise, with difficulty or not at all, be induced to seek professional growth.

The course for the fifth year is as follows:

Compayré's History of Pedagogy, D. C. Heath & Co., Chicago, \$1.25.

Hawthorne's Marble Faun, Houghton, Mifflin & Co., Boston, \$0.75.

Carlyle's Heroes and Hero Worship, John B. Alden & Co., New York, \$0.07.

Postage is prepaid by publishers. Outlines, including analysis and helpful suggestions of the first and second books, will be furnished by the secretary to county superintendents, from whom members may obtain them.

The large number taking an examination in the course of previous years, and the fact that it was found advisable to reduce the number of books read, as was also deemed necessary in Illinois, call for some notice of the courses of the early period of the circle's existence. In the examination of 1888 the reader was questioned on the work of the first and second years, being asked, in general, about ten questions on Smith's English Literature, General History, Hewett's Pedagogy, Parker's Talks on Teaching, and on "mental science." From the ten questions given on each subject any seven, five in the case of Talks on Teaching, might be selected. The examination on the third year's work was on Hailmann's Lectures on Pedagogy, Green's History of the English People, and Watts on the Mind.

But for 1888-89 three books have again been selected, and it is observable that they are all works of pre-eminent merit, which, however true of the pedagogical course of preceding years, was not so in the other courses. In short, they give a *vitality* to the curriculum.

In connection with this work of reading, and as a guide to it, "Outlines" have been prepared for the Marble Faun and for M. Compayré's work on Pedagogy. In preparing the outline of Hawthorne's work the compiler observes: "Three purposes have been kept in view. Under 'contents' has been given a list of topics for each chapter to guide the reader in his study. The divisions under this head are somewhat arbitrary, but seem, in the main, the most natural that could be made. Under 'note' have been given such explanations as to persons, places, etc., as seemed necessary to an understanding of the text. Under 'remarks' it has been the aim not to present an interpretation, but to make such suggestions as would lead the student to 'read between the lines.'" It is advised that the reader should use the topics and notes in connection with his first reading of a chapter; then, after a perusal of the remarks, reread the chapter to discover the deeper meaning. Mr. Alford makes three grand divisions of the work: (1) Crime, the origin of sin; (2) how the guilty escape the consequences of sin; (3) effects of sin on those who are innocent.

The outline of one chapter is given as a specimen of this important feature of the reading.

"CHAPTER 1, VOL. 1.

"MIRIAM, HILDA, KENYON, DONATELLO.

"Contents.—A room in the Capitol and a view from a window—Resemblance between Donatello and the Faun of Praxiteles—A description of the Faun.

"Notes.—Capitol, a building designed by Michael Angelo, located on Capitoline Hill near the centre of Rome.—Dying Gladiator, a piece of statuary representing the pathos of one who received his death wound in the arena [now generally thought to be a Gaul who either has killed himself to prevent captivity, as was the custom of that nation, or has fallen at the hands of the enemy].—Antingus, a representation of a youth who was a great favorite of the Emperor Hadrian. It expresses great sadness.—The Amazon, a war-like woman, represented as trampling her enemies under her horse's feet.—Lycian Apollo, a statue of Apollo at Patora, in Lycia, where he is said to have passed the winter months.—Juno, sister and wife of Jupiter, and queen of all the gods.—Arch of Septimus Severus, an arch erected by authority of law to commemorate the triumph of this emperor over the Persians.—Forum, a vacant space at the foot of the Capitoline Hill, where Roman justice was administered.—Coliseum, an amphitheatre for public entertainments, in the centre of which the gladiatorial contests took place; now the most famous ruin of ancient Rome. * * * Praxiteles, a Grecian sculptor, who lived about 360 B. C.

"Remarks.—'Symbol of the human soul.' In this sentence is given, as perfectly as can be in one sentence, the thought of the entire book—freedom to choose the good amid the evil.

"The characteristics of the Faun as presented in this chapter should be studied in connection with those of Donatello as brought out in the next.

"Is it possible that the Faun might be educated through the medium of his emotions?" The possibility of training the intellect through the emotions is an important thought for the teacher."

The Outlines for the Study of Compayré's History of Pedagogy, by Prof. S. S. Parr, of De Pauw University, are contained in twenty octavo pages. They divide M. Compayré's work into eight groups of chapters, each group representing a month's reading. The ground covered by each group is opened up by "Help questions." The analysis proper is prefaced by an introduction in which the terms educational psychology, general method, special method, history of education, and the philosophy of education are defined and the place and purpose of a history of education discussed.

To the introduction are added some remarks on "the study of the book." Let the teacher ask himself the question: "What am I studying Compayré's History of Pedagogy for?" and to this he should try to obtain a clear answer. To do this let him read the several introductions of the "outlines" and of the work proper, the table of contents, and understand, above all, that "reading, to be of any value, must be translated into well-defined ideas of one's own, which he can state plainly and readily. If meanings of individual words and the general ideas are clear "memory will take care of itself."

As the great question of the day, excluding the greater question of professional teachers which is perennial, is manual training and manual training as a theory of education, we have endeavored to show elsewhere, is but the Froebelian theory, and this last but the outgrowth of Pestalozzi's work, we select as an example of these outlines the work of the seventh month (Chapters XVIII and XIX), which discusses the theories of these authors.

"SEVENTH MONTH.

"Chapters XVIII and XIX.—These parts of Compayré are chiefly devoted to Pestalozzi and Froebel. They are to be read with a view of getting a clear conception of what these two reformers contributed to the progress of education. One should bear in mind that school education is now well differentiated from other forms of development, and that progress consists in pushing forward one or another of the separate interests that make up the whole of education. Pestalozzi represents three ideas: 1. The improvement of the quality of teachers. 2. The advance of method. 3. A more complete definition of the purpose of education. To the end that one may see what Pestalozzi did to elevate the intelligence and character of the teacher, he should read:

"The account of the asylum for poor children at Neuhof.

"The outline of the Evening Hours of a Hermit, and Leonard and Gertrude. These works chiefly represent the author's attempts to define the true aim of education.

"The notice of the schools of Berthoud and Yverdun.

"Pestalozzi's contributions in aid of method appear in: Methods followed at Stanz, and Results accomplished. Methods Simplified. The Socratic Method. Word, Form, and Number. Intuitive Exercises. The Methods Yverdun. Essential Principles.

"Comparison of Rousseau and Pestalozzi.

"Froebel represents a continuation of the same ideas brought forward by Pestalozzi. But he has specialized by laying emphasis on the education of young children, and by advancing to great prominence the development of what he and his master Pestalozzi call individuality.

"These principles appear in: The analysis of The Education of Man; The Kindergartens; The Gifts of Froebel; The Principal Needs of the Child.

"Help questions.—In what sense is Pestalozzi a disciple of Rousseau? Point out the likeness between Pestalozzi and the Englishman Lancaster (p. 424). Did our reformer wish to make education mechanical? Why? (p. 428). What two principles may result from a combination of the three (p. 430)? What new device for teaching geography is first employed at Yverdun? Is Pestalozzi really or seemingly intellectually inferior to others who have filled similar high places? What is the practical lesson of his reform for us? [To learn to deal with the inner instead of playing superficially with the outer.]"

Administration.—"The management of the Indiana Teachers' Reading Circle," says its secretary, "is under the central control of a board of directors appointed by the State Teachers' Association, assisted by local managers in the several counties. The course of reading comprises two lines—professional and general culture studies. Examinations upon each year's work are held annually on the third Saturday of June, conducted by the county superintendents in the several counties. Much of the work of the circle forms a part of the monthly township institutes and is made a part of the township institute, outline published by the State superintendent.

"In December, 1886, the State superintendent was made *ex officio* a member of the central board, and under this provision Hon. J. W. Holcombe served as director till March 15, 1887, Hon. Harvey M. La Follette succeeding him.

"The board of directors consists of the following members and officers:

R. G. BOONE, Professor of Pedagogy, Indiana University.
 EMMA MONT MCRAE, Professor of Eng. Literature, Purdue University.
 MATTIE CURT DENNIS, Richmond.
 JOSEPH CARHART, Professor of English Literature, DePauw University.
 WM. H. ELSON, Superintendent Parke County Schools.
 L. H. JONES, Superintendent Indianapolis Schools.
 HARVEY M. LA FOLLETTE, Superintendent Public Instruction.
 D. M. GETTING, Deputy Superintendent Public Instruction.
 CALVIN MOON, Superintendent St. Joseph County Schools.

"During the first three years a membership and an examination fee, each of twenty-five cents, were charged. Ten cents of the former and fifteen cents of the latter went to the county manager as remuneration for his services and the remainder to the board of directors for its necessary expenses.

"In 1887 the discount usually allowed the trade by the publishers was given to the board and the levy of all fees was abolished.

"In this action the lowest quotable price was obtained upon books and furnished members free of transportation, and the discount paid to the board was sufficient to meet its expenses. This plan has not only secured better prices upon books, but saves the members the additional expense of fees. Had the fees been maintained prices of books could not have been lower; for the price to members is the lowest quotable price to dealers who handle them for the trade. This plan has proved entirely satisfactory and relieved county managers of the annoyance of collecting fees.

"Outlines of the books of the circle are prepared at the circle's expense, sent prepaid by express to county managers, who charge five cents each to members for each outline; this money repays the county manager for any outlay in ordering books and other incidental expenses.

"The county superintendent, who in nearly every case is county manager, has entire charge of the local management, and much praise is due these officers for the efficient manner in which the work has been conducted; the effectiveness of this management is shown in the growth of public sentiment that those who train the young should have a wider intellectual horizon.

"The following table shows the enrolment by years:

1884-5	1,600
1885-6	2,000
1886-7	2,500
1887-8	7,000

"The work of the circle reaches every county in the State, and, in thirty counties, almost every school district. In ten counties the work of the circle is made a part of the contract of every teacher.

"Several reasons may be given for this phenomenal growth: 1. The purpose of the organization is better understood. 2. The course has been lightened. 3. The expense of membership has been reduced. 4. The professional spirit is growing among teachers. 5. The co-operation of county managers is becoming personal as well as official."

YOUNG PEOPLE'S READING CIRCLE.

"This unique organization," says Mr. Getting, "is one of the most promising agencies undertaken by our teachers to promote the general culture of the children and young people of the State. Agitated in 1887, its plans were perfected and presented to the teachers at the county institute of 1888, and now (December 1, 1888) it has a membership of several thousands.

"On December 28, 1887, Prof. Joseph Carhart, professor of English literature in De Pauw University, read a paper before the Teachers' Association (to be found in full in Indiana School Journal of March, 1888) discussing the subject of children's reading at length. As a result of the paper ten thousand tablets setting forth the origin and plan of the organization were printed and distributed by the order of the board of directors. Each tablet contained twenty-one pages, the first page being as follows:

YOUNG PEOPLE'S READING CIRCLE OF INDIANA,

[Organized by the State Teachers' Association, 1887.]

BOARD OF DIRECTORS.

R. G. BOONE, Professor of Pedagogy, Indiana University.
 EMMA MONT McRAE, Professor of English Literature, Purdue University.
 MATTIE CURT DUNN, Richmond.
 JOSEPH CARHART, Professor of English Literature, De Pauw University.
 WM. H. ELSON, Superintendent Parke County Schools.
 L. H. JONES, Superintendent Indianapolis Schools.
 HARVEY M. LA FOLLETTE, Superintendent Public Instruction.
 D. M. GEETING, Deputy Superintendent Public Instruction.
 CALVIN MOON, Superintendent St. Joseph County Schools.

OFFICERS OF THE BOARD.

Professor R. G. BOONE, Bloomington, President.
 Mr. D. M. GEETING, Indianapolis, Secretary.

TO TEACHERS:

"What to read is a far more important question than *how to read*. When a child has acquired the power to read, a vast and before unknowable world opens up before him. On the one hand are means of culture in what is good and great, which impose new duties of unselfish living and excite high ideals through high examples; and on the other hand are possibilities of degradation of many kinds, mental and moral, unknown before. The school has no right to teach how to read without doing much more than it now does to direct the taste and confirm the habit of reading what is good rather than what is bad. The prime object of reading should be the development of a living appreciation of good literature and the habit of reading it rather than the bad, for with this end all others are secured."—*Prof. G. Stanley Hall, Johns Hopkins University.*

"It seems to me that one part of the work of the teacher ought to be to direct the reading of the children. I hope the teachers of this State, so cultivated, so full of zeal and earnestness, will not only teach in school, but will endeavor to direct the reading of their pupils, in order that they become so interested that their evenings will not be spent among vicious associates, but in useful reading."—*Ex-Governor A. G. Porter, to the Indiana Teachers' Association, December, 1886.*

"As a protection against the seductions of the saloon and other places of questionable resort, a taste for and a habit of acquiring common, useful information is so valuable to our young people that it does not profane the Sabbath or prostitute the pulpit to recommend the reading circle."—*A. Martin, President De Pauw University.*

The Indiana Teachers' Association, December 30, 1887, unanimously adopted the following report of the special committee named below, who were appointed to consider the question of organizing a Reading Circle for the school children of the State:

"Your committee, to whom was referred the subject of organizing a Children's Reading Circle, beg leave to report as follows:

"We regard the subject one of the highest importance. To place the general reading of the half million children of the public schools under competent guidance and control, even to a limited extent, would, in our judgment, be productive of most beneficial results. To substitute for the trashy and often vicious reading matter, which finds its way into the hands of the children and youth, a grade of literature, at once sound in its contents, chaste in language and imagery, and pure in its moral tone, is an end which may properly command the best and most earnest efforts of this association, and of the teachers of Indiana. To your committee the enterprise proposed seems a means for accomplishing, in a measure, this highly desirable end. * * * * *

Signed:

W. W. PARSONS, Pres. State Normal School;
 C. W. HODGIN, Prof. of History, Earlham College;
 W. B. OWEN, Superintendent Edinburg Schools;
Committee.

The work of perfecting the organization was referred to the board of directors named above, who earnestly solicit the co-operation of all school officers, teachers, and parents in carrying out the high purpose of the Teachers' Association. The plan set forth in these announcements is a simple one, and it can be modified to suit the peculiar conditions of particular localities, but a standard is here set up which, it is believed, every locality can practically reach. The reading of one good book by each child during the year would be an inestimable blessing, but many, perhaps most, will desire to do more, so there is added to the principal book selected for each grade a supplementary list. It will be observed, on comparing the prices here given with the regular retail prices of the books, that publishers have made very liberal discounts to members of the circle.

Through the local press, by enlisting the ministers of their community, and by conducting special school exercises adapted to the purpose, many teachers will do much more than is here proposed to promote the success of the circle, but it is confidently believed that great good will result from taking the simple steps indicated in the accompanying circulars. It is suggested that after your school has become organized you call the attention of the children to the Young People's Reading Circle, and distribute the slips containing suggestions to parents and pupils, with the request that they present them to their parents and promptly report to you the result. The certificate of membership, signed by the president and secretary of the board, is to be issued when the pupil has read at least one of the prescribed books. By filling out the blank, "to be forwarded to the secretary," you will assist in accumulating information that will be helpful in determining the course for next year.

A Young People's Reading Circle Department is to be conducted in the Indiana School Journal that will give each month interesting items concerning the progress of the work. Any information concerning the circle, such as the number of members enrolled in each grade, the means employed to secure the membership, the influence of the circle upon the children, etc., will be thankfully received by Professor Carhart, Greencastle, who has been appointed to conduct the department in the Journal. Additional tablets may be obtained by addressing the secretary of the board.

Each tablet also contained twenty duplicates of the following page:

To be filled out and forwarded to Mr. D. M. Geeting, Indianapolis, Secretary, when the local membership for the year is complete.

"READ, REFLECT, APPLY."

"From a child I was fond of reading."—BENJ. FRANKLIN.

[Signed.]

R. G. Boone, President.

D. M. Geeting, Secretary.

TO PARENTS AND PUPILS:

"A child that has a fondness for reading has no desire to be among vicious associates. I believe that the best preparation of a boy for a virtuous life is to interest him in good reading."—Ex-Governor A. G. Porter to Indiana Teachers' Association, 1880.

"In my opinion the boy who leaves at the end of a common school course with a love of reading good books is better prepared for a life of honor and influence than one who passes through a high school course without that love. And he who has an ordinary high school education, combined with a taste for good reading, is better equipped for the duties of life than the graduate of the best college or university in the country, without that taste."—Hon. J. B. Peaslee, for twelve years Superintendent of the Public Schools of Cincinnati.

"From a child I was fond of reading, and all the little money that came into my hands was laid out in books."—Benj. Franklin.

"The true university of these days is a collection of books."—Thomas Carlyle.

YOUNG PEOPLE'S READING CIRCLE OF INDIANA.

Organized by the State Teachers' Association, 1887.

BOARD OF DIRECTORS.

R. G. BOONE, Professor of Pedagogy, Indiana University.

EMMA MONT MCRÆ, Professor of Eng. Literature, Purdue University.

MATTIE CURT DEXNIS, Richmond.

JOSEPH CARHART, Professor of English Literature, De Pauw University.

WM. H. ELSON, Superintendent Parke County Schools.

L. H. JONES, Superintendent Indianapolis Schools.

HARVEY M. LA FOLLETTE, Superintendent Public Instruction.

D. M. GEETING, Deputy Superintendent Public Instruction.

CALVIN MOON, Superintendent St. Joseph County Schools.

If you desire to co-operate with the teachers of the State in an effort to direct the tastes of the children and to confirm them in the habit of reading good books, please draw a line under the titles of any books you may desire in the accompanying list, and return this paper to the teacher, who will sign the same, thus entitling the holder to books at the reduced prices named. To secure the books at the prices given, this certificate must accompany the order. Send direct to the publishers, enclosing the price, and the books will be sent by mail. The price of the book in every case includes postage or expressage on the same. Remittances may be made by money order, postal note, or postage stamps.

List of books for 1888-89.

Third Reader Grade—Seaside and Wayside, price, 40 cents, D. C. Heath & Co., Chicago. Supplementary: The Seven Little Sisters Who Live on the Round Ball that Floats in the Air, price, 50 cents, Lee & Shepard, Boston. Friends in Feathers and Fur, price, 33 cents, D. Appleton & Co., Chicago.

Fourth Reader—Stories of Heroic Deeds, price, 33 cents, D. Appleton & Co., Chicago; or, Swiss Family Robinson, price, 33 cents, Ginn & Co., Chicago. Supplementary: Pilgrims and Puritans, price, 60 cents, Ginn & Co., Chicago. Ten Great Events in History, price, 60 cents, D. Appleton & Co., Chicago. Birds and Bees, price (in paper), 15 cents, Houghton, Mifflin & Co., Boston. Robinson Crusoe, price, 35 cents, Ginn & Co., Chicago. Neighbors With Claws and Hoofs, price, 60 cents, D. Appleton & Co., Chicago. Ten Little Boys on the Road From Long Ago to Now, price, 80 cents, Lee & Shepard, Boston.

Fifth Reader Grade—Washington and His Country, price, 75 cents, Ginn & Co., Chicago. Supplementary: Animal Life in the Sea and on the Land, price, \$1.15, Harper & Brothers, New York. Tales From Shakespeare, price, 38 cents, Ginn & Co., Chicago. Franklin's Autobiography, price, 35 cents, Houghton, Mifflin & Co., Boston. Plutarch's Lives, price, 38 cents, Ginn & Co., Chicago. Glimpses of the Animate World, price, \$1.10, D. Appleton & Co., Chicago.

"The hearty and intelligent co-operation of all county superintendents, teachers, the press generally, and especially the Indiana School Journal, gives encouraging assurance that through the Young People's Reading Circle thousands of children who would otherwise either do no reading outside of school text-books or would read trashy and vicious literature will have their lives encircled by the best thought and feeling of the world's best men and women."

IOWA.

At the meeting of the Iowa Teachers' Association in 1884 the president of that body recommended the organization of a teachers' reading circle on the ground that "there ought to be a course of reading adapted to the needs of every teacher who wishes to acquire excellence." From the action taken at this meeting the circle arose.

Purpose.—1. The objects of the reading circle shall be, says the plan of organization, the improvement of its members in literary, scientific, and professional knowledge and the promotion of habits of self-culture. 2. Any teacher or other resident of Iowa may become a member of the circle by signing a pledge to faithfully pursue the prescribed course of reading, and by the payment, in advance, of the membership fee.

Course.—The course of reading covers a period of four years, and consists of selections from three departments: History and art, general and professional; literature, general and professional; science, physical, natural, social, mental, and moral.

The committees on reading recommend to the board books for reading in their respective departments. The board arranges for reviews at the close of each year's course, to be conducted by the county manager. Any person having certified to the careful reading will receive a certificate from the board showing that he has completed the course for the year, and to all, who in like manner complete the work laid out for four years, a diploma will be issued.

Touching the very important question of time, presupposing the inclination, for pursuing this course the management observe:

"By busy people, both men and women, only a short time can be spared each day for reading. Yet no one can afford to use his spare moments for reading without aim or system. It is, therefore, proposed to select a few subjects and choose books which present in a popular manner fundamental facts and principles. All members will read these books; some will read much more.

"It has been the aim to select books suited to the wants of Iowa teachers, and all others who want a better education, but can not get it in school; such books as will inspire a love of reading for the culture it brings. An average of forty minutes' reading each week day will enable the student in nine months to complete the books selected for one year."

In the first circular issued is given this course of reading for the first year:

	Regular price.	Price to members.
HISTORY AND ART. { General: Barnes' Brief General History.....	\$2.00	\$1.40
	Professional:	
LITERATURE. { General: Richardson's American Literature Primer.....	.35	.25
	Professional: Page's Theory and Practice of Teaching.....	1.25 .90
	{ Hunt's Physiology and Hygiene for Young People.....	.65 .50
SCIENCE. { Or, The Eclectic (new), Van Antwerp, Bragg & Co.....	.80	.50
	Physical: Balfour Stewart's Physics.....	.45 .35
	Mental: Watts' Improvement of the Mind (new edition).....

Second, third, and fourth years not yet determined.

In the circular for May, 1887, the last at hand, the four years' course of reading is grouped thus, the course of each year being considered the first year for new students:

FOUR YEARS' COURSE OF READING.

1887-88.	1888-89.	1889-90.	1890-91.
History of Education. Biography. Natural History. Political Economy. Civil Government. General Literature.	Science of Education. U. S. History. Astronomy. Political Science. Physiology. American Literature.	Educational Systems. History of Greece and Rome. Chemistry of Common Life. Mental Science. Physical Culture. English Literature.	Educational Methods. History of England and Germany. Geology and Botany. Moral Science. Christian Evidences or Social Science. Art.

The above outline of future work is subject to such changes as the board of directors may deem necessary and is additional to the two years' courses announced in previous circulars.

COURSE FOR 1887-88.

- 1 { History of Education..... *F. V. N. Painter.*
History of Pedagogy..... *Gabriel Compayré.*
Contributions to the Science of Education..... *W. H. Payne.*
- 2 { Biographical—Great Lives..... *J. I. Mombert.*
Natural History (from page 279)..... *J. G. Wood.*
- 3 { Outline Study of Political Economy..... *G. M. Steele.*
Political Economy..... *J. M. Gregory.*
Political Economy..... *Chapin's Wayland.*
- 4 { Principles of Hygiene..... *Ezra M. Hunt.*
Our Government..... *Jesse Macy.*
History and Civil Government of Iowa..... *Geo. Chandler.*
- 5 Literature—Selections from Hawthorne, Holmes, Irving, Longfellow. Not less than 400 pages.

Any four of the above five topics may be selected, and one book from each selected topic may be chosen, which will constitute the course of reading for the year. Two books may be read each half year, or three if the smaller works be selected. County uniformity is recommended.

Administration.—The Iowa Teachers' Reading Circle, as before remarked, originated in the annual meeting of the State Teachers' Association, held at Des Moines, December 22-24, 1884. The association appointed a committee of nine members, three chosen from each department of the association, with authority to organize a State reading circle, arrange a course of reading, provide for forming local circles, and put the plan into execution; this committee became the board of directors.

The board appoints the county superintendent, or a special deputy in each county as county manager, who shall enroll members, organize local circles of four or more members, receive membership fees and remit monthly to the treasurer of the board, furnish information, distribute books, and have the general direction of the work in his county.

County managers are urged to take the lead in organizing circles in their respective counties. They may call teachers and other interested persons together at any time and explain the objects of the circle, the course of reading to be pursued, and the advantages to be derived. They should advise and assist in organizing new circles, supply them with the necessary blanks, and aid in procuring the needed books.

Any person wishing to organize a local circle may take the names of those who wish to join and send to the county manager. He will receive in return the necessary circulars, blanks, and suggestions for organizing. If there be no county manager the names may be sent direct to the secretary at Davenport.

A leader is to be appointed to enroll members, secure pledges, forward membership fees, and arrange for procuring books, and for future meetings.

Every meeting should be appointed for a definite hour, and all members from the beginning should plan to be on time. The roll should be called and a record made of the attendance, after which the time should be occupied according to a previously arranged programme of readings, questions, reviews, geographical, historical, biographical, or other reference. Dictionaries, maps, and other attainable works of reference may be consulted with advantage.

Methods of conducting local circles are given in the school journals of the State.

Before being admitted the applicant must subscribe to a pledge conceived in the following terms:

"I hereby engage to enter upon and faithfully pursue for one year or more the course of reading as outlined for the Iowa Teachers' Reading Circle."

To defray the expenses of correspondence and printing, and provide for other necessary expenditures an annual fee of 50 cents is asked from each member. If paid in advance, 75 cents will constitute the fee for two years. It is a small amount to the individual members, and its prompt payment and remittance will enable the board to pay necessary bills and plan for the best efficiency and growth of the circle.

The annual membership fees are due September 1, but the fees for new memberships paid after May 1 may be accredited to the ensuing year.

The secretary of the circle, Mr. F. E. Stratton, has kindly furnished a copy of his last report, in which he takes a hopeful view of the prospects of the circle, while repeating the call for enthusiasm already noted in California and several other States.

KANSAS.

The reading circle of Kansas is undergoing reorganization to become a branch of the Chautauqua Teachers' Reading Circle. But its history as an independent body, from its organization, in May, 1885, to the present, deserves mention.

Purpose.—"This circle proposes to all classes of readers a plan of mutual assistance in the work of self-culture by outlining courses of reading and study by securing reduced rates on books, by publishing lists of excellent publications interesting to its members, by suggesting methods of work, and by supplying the incentive of association in study and examination."

Membership seems to be open to all who pay the annual fee of 50 cents.

Course.—Members are not compelled to take any one full course or division; the utmost freedom of selection is recognized. One may take a "teachers' general course," another a "literary relief course," still another a little of both, or apply for more general recommendation.

The teachers' general course is divided into—

FIRST DIVISION.—Kiddle's How to Teach, Page's Theory and Practice, Barnes' General History.

SECOND DIVISION.—Hewett's Pedagogy, Fitch's Lectures on Teaching, Gregory's Political Economy.

THIRD DIVISION.—Bain's Education as a Science, Sully's Psychology (ed.) abridged, Swinton's Classical English Reader.

The "literature relief course" (as distinguished, presumably, from the more irksome professional course) is also grouped in three divisions, as follows:

FIRST DIVISION.—Goldsmith's Deserted Village, 1st mo.; Coleridge's Ancient Mariner, 2d mo.; Irving's Sketch Book, 3d mo.; Lamb's Tales from Shakespeare, 4th mo.; Chas. Kingsley's Westward, Ho!, 5th and 6th mos.

SECOND DIVISION.—Hawthorne's Tales of a Grandfather, Part I, 1st mo.; Part II, 2d mo.; Part III, 3d mo.; Hawthorne's Biographical Stories, 4th mo.; David Copperfield, 5th and 6th mos.

THIRD DIVISION.—Merchant of Venice, 1st mo.; Macbeth, 2d mo.; Tempest, 3d mo.; Pope's Essay on Criticism, 4th mo.; Henry Esmond, 5th and 6th mos.

In addition to these there is, or was, a "juvenile course" which was recommended to teachers for introducing a course of reading to the attention of the young in their several school districts, as follows:

FIRST GROUP.—Tales of a Grandfather, by Sir Walter Scott; Robinson Crusoe, Book of Fables, Jno. B. Alden, publisher, N. Y.

SECOND GROUP.—Eminent Americans, Dickens' Child's History of England, Jno. B. Alden, publisher, N. Y.; Arabian Nights, edited by Rev. E. E. Hale.

THIRD GROUP.—Pilgrim's Progress, Creasy's Decisive Battles, Hawthorne's Grandfather's Chair.

Administration.—The management is a board of five directors elected annually. Any association might organize itself as a county reading circle by electing a county secretary, and local circles subordinate to these might also be formed.

The annual fee gave the member the privilege of obtaining the books of the course at reduced prices, the various circulars of suggestion and information issued from time to time and of examination semi-annually. A certain portion of the membership fee is retained by the county secretary, who remits the residue to the treasurer of the board of directors.

Before speaking of the change now being instituted a quotation is given from a letter of Mr. Hill, the secretary of the reorganized circle, and to whom our thanks are due for information on this subject:

"Under the old organization about forty circles were formed, with a membership aggregating not quite 800. But few circles are now in existence, though the interest man-

ifested indicates a prosperous career for the new organization. But little has been done for over a year past."

The change now taking place is fully explained by the following circular:

CHAUTAUQUA UNIVERSITY.

C. T. R. U.

THE KANSAS STATE TEACHERS' READING CIRCLE.

A. R. TAYLOR, *President*.Emporia.

F. H. CLARK, *Vice-President*, Minneapolis.

J. H. HILL, *Secretary*Emporia.

EMPORIA, KANSAS, November 16, 1888.

To the Teachers of Kansas:

After numerous unavoidable delays—delays arising from the change of secretaries, the continued illness of the general secretary of the Chautauqua Teachers' Reading Union, and other causes for which the officers of the Kansas Circle are not responsible—we are glad to be able, in accordance with the instructions of the friends of the Kansas State Teachers' Reading Circle at their last meeting at Topeka, to give in the accompanying circular full and definite suggestions embodying the information desired as to the organization of Teachers' Reading Circles auxiliary to the Chautauqua Teachers' Reading Union. * * *

The advantages of belonging to a national organization like the C. T. R. U., which is a department of the Chautauqua University, need scarcely be enumerated. Among them are the recognition of the work done by the diploma given, signed by the officers of the University; the opportunity for reduced rates in the purchase of books in the course of reading; the privilege of the Socratic League, including the gratuitous receipt of the Socratic League leaflets; the suggestion of the post-graduate and collateral courses in addition to the prescribed work, with due recognition of the same; and, above all, the inspiration, sympathy, and assistance of a multitude of co-readers, as an incentive to the noblest effort. The State organization exists simply for the purpose of giving all possible co-operation and suggestion to facilitate the organization of local circles—thus furthering by the agencies at its command this noble movement for self-culture. All the advantages of the former State organization are preserved, while much is gained by the transfer of a large part of its machinery to the National Union. Shall we not have from the Kansas teachers a general response, and with the new year see our reading circles in active operation all over the State? * * *

J. H. HILL,
Secretary, Emporia, Kansas.

A. R. TAYLOR,
President.

MARYLAND.

This circle is but a thing of yesterday. The present chairman of its board of directors was selected to read a paper on Reading Circles at the meeting of the teachers' association in July, 1888, which led to the organization explained in the following circular, which Prof. Alex. Chaplain has kindly furnished:

Baltimore, August 23rd, 1888.

To the Examiner of County:

DEAR SIR:

At the last meeting of the State Teachers' Association the advisability of organizing a State Teachers' Reading Circle was fully discussed and decided upon, and a board of directors, consisting of the following persons, Prof. Alex. Chaplain, Easton; Prof. Jacob Goodman, and Mrs. M. A. Newell, Baltimore, was appointed for the inauguration and management of the same.

The duties of the directors are to prescribe and to outline, if necessary, a course of reading, to arrange examinations, and to attend to all the literary and business interests of the circle.

One of the great needs—perhaps the greatest need of our teachers—is more extensive culture. Many of them, while possessing fine disciplinary ability, perseverance, patience, and conscientiousness, are wanting in the general information so essential to the successful prosecution of their work. To supply this want, to some extent at least, is the prime object of the reading circle.

Aside from the great good that would result to our schools and communities from the more liberal cultivation of our teachers, there is another important consideration—along with the increase of knowledge, the profession would increase in dignity and importance and would advance to a higher platform of social, intellectual, and political recognition—in short, would become the power in the land, which it deserves to be.

Believing that the success of this effort depends very largely upon the co-operation of the examiners, the directors confidently appeal to you. Will you not use all the means in your power to awaken the interest of the teachers in your county? We would suggest that you send a circular letter to them setting forth your opinion of the importance of this work and urging them to connect themselves with it.

The fee for membership is 25 cents per annum. The books prescribed by the directors will be furnished the teachers at reduced rates.

The first meeting of the board of directors was held at the State Normal School Thursday, August 23, 1888, at which meeting the enclosed suggestions were adopted and a course of reading, embracing general culture, pedagogics, and mental philosophy, agreed upon for the first year. Full particulars regarding the price, etc., of the necessary books will be furnished in a later circular.

We shall be pleased to hear from you in this connection and shall be grateful for any suggestions you may offer. Please oblige us by a reply by the 10th of September. All communications must be addressed to Mrs. M. A. Newell, State Normal School, Baltimore.

By order of the board.

CHARLOTTE NEWELL,
Secretary.

The board of directors, each member of which is chosen for three years, selected at their first meeting the course of reading for the first year. In pedagogy this consists of Swett's *Methods of Teaching*; in mental philosophy, Allen's *Mind Studies for Young Teachers*; in general culture, Mackenzie's *History of the Nineteenth Century*. To "outline" one of these works was the duty of a member of the board. To Mr. Chaplain was entrusted Swett's *Methods*; to Mr. Goodman, Allen's *Mind Studies*, and to Mrs. Newell, Mackenzie's *Nineteenth Century*. From the "outlines" of the last work is selected the following illustration. The matter refers to the third part of the first chapter of Mackenzie's work:

"Part III—1778.—Locate Ferney.

"Rousseau; his influence; the style and character of his principal work, *Émile*.

"Necker; the public positions held by him; his *compte rendu*; his daughter, Madame de Staël.

"The American Revolution in its probable relations to the French Revolution.

"Lafayette; his influence in hastening the French Revolution; his connection with American affairs as a factor in determining his subsequent opinions and actions.

"Benjamin Franklin; illustrate through him the effect of perseverance and energy; his influence at the French court. Give a brief sketch of the discoveries in electricity prior to Franklin.

"*Books of Reference*.—Lives of the Most Eminent French Writers, by Mrs. Shelley; Green's *Short History of the English People*; Thier's *French Revolution*; Headley's *Life of Lafayette*; McMaster's *Life of Benjamin Franklin*, in the *American Men of Letters Series*."

As few reports have been received as yet by the board of directors no positive statement can be made as to the membership, but it is estimated at 2,000.

MICHIGAN.

Information from this State is succinct though not encouraging. "The reading circle has ceased to be an organization in this State," says Superintendent David Howell, of Lansing.

MINNESOTA.

State Superintendent Kiehle writes: "A State teachers' reading circle was organized in Minnesota, but was soon abandoned on account of the difficulties attending a successful organization."

MISSISSIPPI.

Principal Haven, of the Winona Academy, reports under date of December 19, 1888, that the teachers of Mississippi have failed so far to effect a regular organization in the State. "The Teachers' Association," says Mr. Haven, "convenes on the 28th and 29th inst. and it may be that we will go into regular organization at that time. * * * I enclose you our circular to the teachers, which will give you about all that has been done as yet."

From this circular it is learned that at the meeting of the State Teachers' Association held at Jackson, Miss., December 27-29, 1887, a resolution was adopted by unanimous vote favoring the immediate organization of a State Reading Circle. A committee was appointed to effect this organization.

Purpose.—It is the purpose of this Reading Circle to arouse a spirit of reading among the teachers of the State, and thus to elevate the standard of scholarship and improve the teachers and the schools. It is also desired to bring about a community of feeling and interest; to secure a better understanding of the laws of the child's mental, moral, and physical being, and to bring the teacher nearer to a true profession.

"All this can be easily secured if the county superintendents and leading teachers will determine to have it so; and it is hoped that the superintendents will not let their teachers rest until there is a working organization in every county of the State. It will be of incalculable benefit to the teachers in bringing before them the true greatness of the work in which they are engaged and in preparing them for better schools, more constant employment, and more remunerative returns for their work.

"Teachers, like pupils, need stimulating. They do better work when they feel the necessity for it. May we not hope that the committee will be able to report fifty or sixty counties with organized circles at the next annual meeting of the State? It is possible; it is very desirable; it will be most profitable."

Course.—The work of the first year has been arranged to consist of the following studies:

	Usual.	Special.
1. Page's Theory and Practice of Teaching.....	\$1.25	\$1.00
2. Watts on the Improvement of the Mind.....	.75	.65
3. Miss Duval's History of Mississippi.....	1.00	.60

The work of the first year is but the beginning. For each successive year additional work will be arranged. Thus the teacher will be supplied with an excellent working library of valuable books, gathered little by little and carefully studied in detail. Membership in the circle will enable teachers to secure these books at a very considerable reduction from the rates at which they are generally sold.

The outlines of the work will be published for each month in advance in the Mississippi Teacher. They will be of great value to every member of the circle. The Mississippi Teacher is, by action of the State Teachers' Association, the State official organ, and as such should be in the hands of every teacher in the State.

Administration.—The management of the affairs of the circle seems to be as yet vested in the committee of nine, which was appointed to effect an organization. The reading circle year is to begin with the first day of March, 1888, and consist of the nine months next following that date.

Inquiries relative to the circle and its work may be addressed to any member of the committee. A stamp should be inclosed for reply.

MISSOURI.

"There is nothing being done in the way of teachers' reading circles, either State or local," says the State superintendent.

NEBRASKA.

"To the best of my knowledge this matter has been generally neglected in Nebraska for the last two years," says State Superintendent Lane. "The public school teachers are giving the time formerly devoted to the reading circle to professional study, while the Chautauqua circle seems to attract others."

NEW JERSEY.

The Bureau was promised an article on this subject from a competent hand, but unfortunately the promise could not be kept.

NEW YORK.

The report which Mr. Jerome Allen, of New York City, has furnished, at the request of the State superintendent, is as follows:

"The reading circle of this State is not at present in a very active condition. It would be impossible for me to state all the causes for this circumstance, but I will say in brief it is mainly from want of interest in professional reading on the part of the rank and file of the teachers. The graduates of colleges and normal schools do not feel an interest in this reading, as they have already laid out a course of study and are pursuing that independent of any reading circle. The younger teachers who remain in the work but a short time and receive at best only second-grade certificates have no interest to improve themselves. They are living up to the demands of the community they are in, and, not intending to make teaching a life-work, they do not exert themselves to improve.

"In my opinion reading circles should receive definite encouragement from the State superintendent of public instruction. A law should be passed authorizing him to give certain certificates to those who complete specified reading work laid down by the department. This might or might not be a prerequisite to the obtaining of a State certificate. If in some way it could be connected with State recognition it would be of great use. But an organization without State recognition, or any public encouragement, stands very little chance of meeting with success in this State. The effort has been made earnestly and thoroughly, and although the outlook of the New York State Reading Circle seemed at first to be promising, yet the result has shown that it did not meet with that encouragement from the teachers and officers that was necessary in order to make it a complete success."

NORTH CAROLINA.

"We have but one circle," says the State superintendent, "and it is connected with the assembly [Teachers' Association of the State]." Subsequent enquiries have failed to elicit further information.

OHIO.

It may be inferred that the Ohio circle is strictly a teachers' organization from the following extract from its last circular:

"While our organization is known as a Teachers' Reading Circle, its work is of special value to all who are intending to become teachers.

"A large number of pupils who have recently completed the course of study in the high schools of our State expect to engage in the work of teaching. To all such the reading circle offers an excellent opportunity for further improvement and for some degree of special preparation for their important work."

Course.—The success of the reading circle during the past year has been such as to warrant the board of control in arranging work for a sixth year. Nearly two hundred diplomas have already been given to those who have completed the work of four years. The receipts of the treasurer for the past year indicate a paid membership of more than one thousand, and the reports from the various counties show that fifteen hundred teachers have taken the course as a whole or in part.

In order that the work of the coming year may be made more interesting and valuable to members the board of control has arranged with different persons to furnish a series of helpful articles upon the subjects presented in the different departments of the course. These articles will appear from month to month in the columns of the *Educational Monthly*, beginning with the September number.

The work should be commenced in the early part of the school year in order that it may be completed in June.

Readers may begin with any year they choose. Certificates are given to all members who complete in a satisfactory manner the work of any year. Those who complete the work of any four years are entitled to a diploma without additional payment. The diplomas are presented at the annual meeting of the Ohio State Teachers' Association.

All members who are entitled to diplomas and who wish to receive them should send their names to the corresponding secretary of the board of control on or before June 1, in order that they may be properly prepared in advance of the meeting.

COURSE OF READING SELECTED FOR THE SIXTH YEAR (1888-89).

- I. PEDAGOGY.—Compyré's Lectures on Teaching, or Calderwood on Teaching.
- II. LITERATURE.—Shakespeare's Henry IV, Irving's Knickerbocker's History of New York, and Macaulay's Essay on Warren Hastings.

III. HISTORY.—A selection from the "Old South Leaflets," as follows: No. 1. Constitution of the United States. 2. Articles of Confederation. 4. Washington's Farewell Address. 5. Magna Charta. 10. Washington's Inaugurals. 11. Lincoln's Inaugurals and Emancipation Proclamation. 12. The Federalist, Nos. 1, 2, and 3. 13. The Ordinance of 1787.
The Constitution of Ohio published in leaflet for the special use of the Ohio Teachers' Reading Circle.

COURSE OF READING PREVIOUSLY ADOPTED.

FIRST YEAR—1833-34.

- I. In PEDAGOGY, one of the following: Hailman's History of Pedagogy, Krusi's Pestalozzi, Quick's Educational Reformers.
- II. In ENGLISH POETRY, one of the following: Longfellow, Whittier, Lowell—life and poetical works.
- III. In AMERICAN HISTORY, the discovery and early settlement of North America, to 1776.

SECOND YEAR—1834-35.

- I. PEDAGOGY.—Currie's Common School Education, or Calderwood on Teaching.
- II. LITERATURE.—Shakespeare's Julius Cæsar, and Irving's Sketch Book.
- III. U. S. HISTORY.—The Revolution and the Constitutional Period to the close of the War of 1812.
- IV. NATURAL SCIENCE.—Brown's Physiology, or Science Primer of Physiology and Hygiene.

THIRD YEAR—1835-36.

- I. PEDAGOGY.—Payne's Lectures on the Science and Art of Education.
- II. LITERATURE.—Shakespeare's Richard III, and the Merchant of Venice, Scott's Ivanhoe, and Tennyson's Princess.
- III. HISTORY.—United States History from the close of the War of 1812 to the present time.
- IV. NATURAL SCIENCE.—The Science Primer of Physics by Balfour Stewart.

FOURTH YEAR—1836-37.

- I. PEDAGOGY.—Sully's Teacher's Hand-Book of Psychology.
- II. LITERATURE.—Shakespeare's Hamlet, and As You Like It, Selections from Wordsworth.
- III. HISTORY.—Barnes' Brief General History of the World, or Thalheimer's General History.
- IV. POLITICAL ECONOMY.—Gregory's Political Economy, or Chapin's First Principles of Political Economy.

FIFTH YEAR—1837-38.

- I. PEDAGOGY.—White's Elements of Pedagogy.
- II. LITERATURE.—Shakespeare's Henry VIII, and Hawthorne's Twice Told Tales.
- III. HISTORY.—Any brief history of the United States to be supplemented by the History of Ohio. (Barnes' General History of the World, for such as have begun but not completed it, may be taken as a substitute for the history of the United States.)
- IV. Gregory's Political Economy or Chapin's First Principles of Political Economy.

Administration.—There is no constitution, nor are there by-laws for the State circle, the local circle adopting its own form of government. The governing body is a board of control composed of nine members, one of whom, the State commissioner of public schools, has membership by reason of his office.

Every member of the reading circle is expected to pay each year a membership fee of 25 cents. This should be paid at the beginning of the year, when the circle is organized, to the treasurer of the local circle, and should be transmitted by him to the corresponding secretary for the county, who will remit the same to the treasurer of the board of control. Individual membership receipt blanks will be furnished to each county.

In the circular for 1838-39, the board of control say:

"The amount received for membership fees is absolutely needed to meet the expenses of the reading-circle. As parchment diplomas are now given, the expense is much greater than heretofore. We have had in the past many readers who were not members. It is hoped that in the future all readers will pay the small fee that is required, and thus become members of the State circle, and help to defray the necessary expenses of the organization.

"In counties where there are no local circles individuals can read the course, and by re-mitting their membership dues directly to the treasurer of the board of control they will be recorded as members of the Ohio Teachers' Reading Circle.

"The board of control requests the teachers of each county to elect at their next institute a corresponding member, and to report the name at once to the corresponding secretary of the board. It will be the duty of the member thus elected to superintend the organization of local circles, to distribute such circulars and documents as may be issued by the board from time to time, and to procure and fill out certificates for those who desire them. He should also make an annual statement to the corresponding secretary of the board of control of the number of local circles and members, and of the work done in

the county during the year. This report should be sent to the secretary not later than the middle of June, in order that he may make a full report to the Ohio Teachers' Association at the State meeting. Blanks are furnished for this report, as well as for a preliminary report from each county branch or local circle."

OREGON.

A letter from State Superintendent McElroy says: "Very little has been done so far in this State relative to the establishment of teachers' reading circles.

"The school work of this State is yet in a formative condition, and we have had so much pioneer labor to perform that we have not been able to take many of the advanced steps in education.

"We realize the great importance of reading organizations in this country, and we hope to secure some favorable legislation in this direction at the coming session of the Legislature."

Mr. McElroy then refers to several ladies and gentlemen of the State, but from those addressed nothing has as yet been received.

RHODE ISLAND.

Rhode Island, though small, does not lack individuality. Its teachers' association is called an Institute of Instruction, and has for its object the improvement of the public schools of the State, and every member of the Rhode Island Institute of Instruction is a member of the Reading Circle. There are no extra fees. It is recommended that each shall read at least one volume in Pedagogy. By reading three pages a day, five days in the week, one can read a volume of four hundred pages before the next annual meeting in October. Those who are teaching history, literature, or any subject in the other departments, will find it helpful to read the books recommended by the directors of those departments. The directors will be glad to answer any inquiries or to give further information to any who desire it, in relation to books, methods of study, or other points of interest in their departments.

The following are the various departments and the books recommended in each:

I. PEDAGOGY.

THOMAS B. STOCKWELL, director.

Rousseau's *Émile* or Pestalozzi's *Leonard and Gertrude*. Published by D. C. Heath & Co., Boston. Price, 75 cents each.

Prince's *Courses and Methods*. Published by Ginn & Co., Boston. Price, 75 cents.

The course of reading recommended for the ensuing year is a double one, combining both theory and practice. In the first two books recommended we have the substance in an attractive form of two educational classics. There is little in modern pedagogy that does not go back to Rousseau and Pestalozzi, and it has seemed to me wise to direct the attention of teachers to these two sources of the present system of educational training and culture.

Émile is the earlier in point of time and is more thorough in its treatment of the subject, covering the whole province of education from birth to youth. There is but little pretense to a story, although it is called a romance. There are positions taken from which we shall probably dissent, but on the other hand, we shall be surprised to find how much there is with which we shall agree.

Leonard and Gertrude is quite an entertaining story of peasant life in Europe which shows how the introduction of correct principles of life and action, especially in connection with the training of the young, may reform a community and impart to it a new and a higher life.

A careful reading of either or both of these little books will amply repay the cost of time and money in the stimulus they will afford and the opportunity they will give for a re-adjustment and a new settlement of our plans of action.

Prince's *Courses and Methods* has been chosen—First. In the belief that to a great many teachers its outline of a regular, progressive, and symmetrical order of studies will be of great help. Much good teaching is rendered practically of little value for the lack of just such a basis as this book will furnish.

Second. Because its plans for the presentation of the various subjects of Reading, Spelling, Writing, Language, Grammar, Geography, Arithmetic, History, Physiology and Hygiene, Drawing, Singing, Observation Lessons, and Information Lessons are believed to be valuable both in themselves and as models for the teacher's use in other directions. It is essentially a "hand-book" for the school-room.

II. HISTORY.

F. W. TILTON, director.

Nowhere is systematic study more essential than in the department of history. Before attempting to recommend a course of reading and study for the next year, I have deemed it important to inquire what the work of the "Reading Circle" has been in this direction. I find that two years ago the members were advised to read Fisher's *Outlines of Universal History*, and suggestions of the greatest value were given by Professor Andrews as to the method and spirit in which the work should be done. I heartily recommend that these suggestions be again brought, in some convenient form, within reach of every member of the "Reading Circle." A year ago the same book was again recommended, with a suggestion that the members also follow a course of reading upon United States History.

These recommendations are in entire harmony with what I believe to be the true method of historical study: viz, to begin with a general view of the whole field of history, and then to pass on to more minute study of important periods. This method is adopted and carried out almost to perfection in the schools of Germany, and there is little doubt that it will become more prevalent in our own schools than it has been in the past. The medical student does not make a minute study of the heart before he has any idea of the structure of the body as a whole. Critical study of a brief epoch in the history of a single people, with no knowledge of earlier or contemporaneous events, is scarcely more sensible.

I deem it wise to read with great care a good summary of general history every year. An ordinary memory needs this amount of quickening to keep the cardinal events clearly defined. Something is to be gained, doubtless, by occasionally changing the book used for this purpose. Fresh interest is thus awakened, and the facts are presented to the mind in different lights. As special attention has been given to United States history the past year, it seems to me advisable to suggest that a reasonably full work upon English history be now mastered. I accordingly recommend the following courses for the ensuing year:

(A) GENERAL HISTORY.—A careful reading of one or more of the following, observing the suggestions of Professor Andrews regarding abstracts, etc.: Fisher's *Outlines of Universal History*; Miss Sheldon's *General History*; Myers' *Outlines of Ancient, Medieval, and Modern History*, 2 vols.; Freeman's *General Sketch of History*; *Outlines of the World's History*, by Swinton.

(B) ENGLISH HISTORY.—A similar reading of Green's *History of the English People*, 4 vols. Published at \$6; can be bought for about \$3.50.

III. LITERATURE.

ELIZABETH C. SHEPLEY, director.

1. Chaucer's *Prologue to the Canterbury Tales, with the Knight's Tale*. Clarendon Press edition. MacMillan, New York; 60 cents.

2. Mrs. Oliphant's *Makers of Florence*. MacMillan; \$2.25.

3. *Romola*, in any edition.

For any teachers who wish for text-books on English literature nothing can be better than those proposed in the first year of the Reading Circle: Stopford Brooke's *Primer* and Mrs. Oliphant's *Literary History of England*. Those who have read these, especially if they have added Taine's *English Literature*, and who wish for any advice in the selection of literature for delight and refreshment, are heartily recommended to the books I have named at the head of my paper. In the first and second they will find an agreeable introduction to the earliest great poet of the English language, and to the sources from which he largely drew his inspiration. In this connection they will readily be reminded to reread George Eliot's story of Florence, *Romola*.

IV. LANGUAGE.

T. WHITING BANCROFT, director.

I. *The Life and Growth of Language*, by Prof. W. D. Whitney, in the International Scientific Series, published by D. Appleton & Co., New York; 326 pages.

II. *The Philology of the English Tongue*, by Prof. John Earle. Oxford, at the Clarendon Press; 700 pages; \$1.75; third edition.

III. *The English Language*, by Prof. J. M. D. Meiklejohn. D. C. Heath & Co., Boston; 388 pages.

These works are suggested as a comprehensive course of reading on the subject of language.

The first is an outline of linguistic science, discussing such topics as how each individual acquires his language, change in the outer form of words, change in the inner content of words, loss of words and forms, production of new words and forms, the name-making process, Indo-European language, other families of language, nature and origin of language, and the science of language.

The second is an elementary philological treatise on the English language, embracing such subjects as a historic sketch of the rise and formation of the English language, the English alphabet, spelling, and pronunciation, the parts of speech, the verbal group, the noun group, the pronoun group, the link-word group, syntax, compounds, and prosody.

In a clear and lucid manner the author treats of the leading philological principles of the English language, so that the whole subject is presented in a most attractive light.

The third work recommended is just published. It is a condensed summary of the grammar, history, and literature of the English language. It is divided into four parts.

Part I is grammatical, considering such topics as etymology, syntax, analysis, word-building and derivation, word branching, etc.

Part II is rhetorical, presenting the subjects of composition, punctuation, figures of speech, paraphrasing, etc.

Part III is historical, with the following order of topics: The English language and the family to which it belongs, the periods of history of the English vocabulary, history of the grammar, specimens of English of different periods, modern English, and land-marks in the history of the English language.

Part IV contains a brief history of English literature with tables of English literature.

V. GEOGRAPHY.

CHARLOTTE E. DEMING, director.

The Earth as Modified by Human Action, by George P. Marsh, published by Charles Scribner's Sons. Price (edition of 1885), \$2.70.

This book is valuable for either consecutive or topical reading. The author was a wise observer of nature in both hemispheres, as well of her minutest as of her grandest operations, and his conclusions are those of a scholarly, practical man.

It is difficult to give an idea of the scope of the work by quoting a few of the subjects treated, but perhaps the following may be mentioned:

Natural advantages and physical decay of the Roman Empire, reaction of man on nature, human and brute action on nature compared, limits of human power, physical conservation and restoration, origin of domestic plants, vegetable power of accommodation, influence of animal life on vegetation, origin and transfer of domestic quadrupeds, introduction of fish, birds, and insects, utility and destruction of reptiles, marine and inland waters, sand dunes, projects of physical changes accomplished or proposed by man, as cutting marine isthmuses—Suez Canal, Cape Cod Canal, diversion of the Nile.

The author has treated in an interesting manner the subjects—trees and their influence, American and European forests and forestry.

In view of the increasing interest in trees and forests, owing to the observance of Arbor Day by our schools, it may not be out of place to call attention to Vol. 9 of the Tenth Census Report, which embodies the researches of Charles S. Sargent, professor of Arboriculture in Harvard University, and others, with relation to forest trees of North America. The bibliographical list which accompanies Mr. Marsh's book is excellent.

VI. SCIENCE.

GEORGE F. WESTON, director.

Natural science is especially useful in quickening the perceptive powers of pupils; and that teachers may be aided in this line we recommend the following guides for science teaching:

- I. About Pebbles. Prof. Alpheus Hyatt.
- II. Concerning a Few Common Plants. Prof. George Goodale.
- III. First Lessons in Natural History. Mrs. Elizabeth Agassiz.
- IV. Hydroids and Coral. Professor Hyatt.
- V. Commercial and other Sponges. Professor Hyatt.
- VI. First Lessons in Minerals. Miss E. H. Richards.
- VII. Common Minerals and Rocks. Prof. W. O. Crosby.

These little volumes are issued by Heath & Co., Boston, Mass.; Nos. 1, 2, and 6 costing 10 cents each, mailing price; No. 3, 25 cents; Nos. 4 and 5, 20 cents; No. 7, 25 cents.

SOUTH CAROLINA.

Mr. James H. Carlisle, of Spartansburg, to whom the Bureau was referred for information by the State superintendent, reports that the teachers' reading circle has not taken root in this State. Mr. Carlisle says:

"I am sorry that I can give no satisfactory account of the teachers' reading circles in our State. In some of our towns the teachers connected with our public schools are required to meet regularly and to pursue some course of reading. But I know of no regular Chautauqua teachers' circle in operation. There are several Chautauqua literary and scientific circles, but I know of no teachers' circle. The News and Courier of December 7, 1888, speaks of an attempt to organize such circles. I will write to parties mentioned in connection with the enterprise, and will take pleasure in giving you any information I may obtain."

As we have not heard from Mr. Carlisle we assume that his courteous efforts to obtain information for us have been unsuccessful.

TENNESSEE.

"The teachers' reading circle is dead in Tennessee," says State Superintendent Smith.

WEST VIRGINIA.

"It is not possible to give exact information in regard to the teachers' reading circle in West Virginia," says B. S. Morgan, State superintendent. "We have no State organization nor officer who has any record of work done in the State.

"I prepared a plan for the organization of circles by counties three years ago, and submitted it to the State Educational Association for its approval. The plan of organization and course of study were adopted, and since that time reading circles have been established in at least twenty-five counties. The work has met with the general approval of the teachers, and will prove an effectual organization in this State. I am now making arrangements to have a State organization established at next meeting of the State Educational Association, which will make the reading circle far more effective than it now is. I regret I cannot give you more information on this subject."

WISCONSIN.

"The history of the movement for teachers' reading circles in this State is not encouraging," says J. W. Stearns, professor of the science and art of teaching in the University of Wisconsin. "The organization was first effected in 1885, at the summer meeting of the Wisconsin Teachers' Association. The first board of directors was: J. W. Stearns, J. B. Thayer, Robert Graham, W. H. Beach, C. A. Hutchins, William Jones.

"This board organized by electing W. H. Beach chairman and J. W. Stearns secretary. An effort was made to interest the teachers at the fall institute, and a large number of county superintendents took hold of the work. Blanks for reporting were prepared and distributed, and circles organized in many parts of the State.

"The enrolment reached 1,506 members. Few reports were received of work done, and it soon became apparent that the real success of the movement depended upon the constant efforts of county superintendents, together with the ability of the circle teachers as organizers. The elections occurred in 1886, and these displaced from office a considerable number of superintendents who had been active in organizing and carrying on the work, and in almost every such case the work fell to the ground in the county. Others found that success required of them more labor than they could give in addition to the regular work of their office. Thus during the second year there was a great falling off in interest, and the enrolment did not reach above three hundred. The same persons were continued in the board, but the discouragement consequent on the year's experience prevented the inauguration of new efforts. There are now in the State a few circles, but no regular reports are made, and it is impossible to state numbers or work done."

CHAPTER XXII.

OBITUARY LIST OF NOTABLE EDUCATORS.

CONTENTS—Introduction—Number in the list—Other pursuits of the dead—Their ages at death—American list—Foreign list.

The necrological list of one hundred and sixty-three names here presented is confined except in a few cases to the year that ended June 30, 1888. It comprises the names of such persons, American and foreign, whose deaths were noticed during the period in prominent journals, because they had had some real connection with education whether as teachers, writers, or benefactors.

The other pursuits with which their names were associated included astronomy, banking, botany, chemistry, commerce, engineering, geology, journalism, law, library work, literature, mathematics, medicine, mineralogy, music, paleontology, philology, philosophy, physics, political economy, sociology, surgery, teaching, theology, war, and zoölogy.

The American list comprises one hundred and ten names and the foreign list fifty-three; this difference is explained by the greater facilities existing for obtaining information about natives.

Their ages may be grouped by quinquennial periods as follows:

Number between ages mentioned.	Amer-ican.	For-eign.	Total.	Number between ages mentioned.	Amer-ican.	For-eign.	Total.
21-25.....	2	2	66-70.....	13	10	23
26-30.....	1	1	2	71-75.....	13	2	15
31-35.....	2	2	76-80.....	17	9	26
36-40.....	5	2	7	81-85.....	11	3	14
41-45.....	5	5	86-90.....	4	5	9
46-50.....	5	4	9	Over 90.....	1	1
51-55.....	9	4	13				
56-60.....	8	6	14	All ages.....	110	53	163
61-65.....	15	6	21				

The aggregate ages of the Americans was 6,759 years, or 64.65 years per capita; of the foreigners, 3,561 years, or 67.24 years per capita. The per capita for Americans and foreigners combined was almost exactly 65.5 years.

AMERICAN.

ABELL, Arunah S., in Baltimore, Md., April 19, 1888, aged eighty-one years; founder and principal owner of the Baltimore daily Sun newspaper; one of the associates of Prof. S. F. B. Morse in establishing the first telegraph lines in this country, etc.

AGNEW, Cornelius Rea, A. M., M. D., in New York City, April 14, 1888, aged fifty-seven years; educated at Columbia College and the College of Physicians and Surgeons, New York; clinical professor of eye and ear diseases in the latter; trustee of the city public schools, 1859; trustee of Columbia College, 1874; one of the founders of the U. S. Sanitary Commission, 1861; of the Union League Club of New York; an eminent surgeon in his special branches, and a Christian gentleman of the most lovely character.

ALCOTT, Amos Bronson, in Boston, Mass., March 4, 1888, aged eighty-eight years; widely known as a lecturer, essayist, philosopher, and mystic, and honored by the sincere regard of such men as Longfellow and Emerson.

ALCOTT, Miss Louise M., in Boston, Mass., March 6, 1888, aged fifty-five years; famous as a writer of charming books for young people, notable among which are *Little Women*, *Little Men*, *Eight Cousins*, etc.

- ANDREWS, the Rev. Israel W., A. M., D. D., LL.D., in Hartford, Conn., April 18, 1888, aged eighty-seven years; professor of moral philosophy in Marietta College, Ohio, 1835-85; president, 1855-85; vice-president and professor of political economy, 1885-88.
- ASTOR, Mrs. Charlotte Augusta [Gibbes], in New York City, December 12, 1887, aged sixty-two years; a most liberal giver to schools, hospitals, orphan asylums, and other charities.
- AVERY, John, A. M., LL.D., in North Bridgeton, Me., September 1, 1887, aged fifty years; professor of Greek in Bowdoin College; a noted Orientalist.
- BAIRD, Spencer Fullerton, A. M., LL.D., in Wood's Holl, Mass., August 19, 1887; born in Reading, Pa., February 3, 1823; educated at Dickinson College, Pa.; professor of chemistry and natural history in the same, 1845-50; assistant secretary of the Smithsonian Institution, Washington, D. C., 1850-78; secretary of the same, 1878-87; U. S. Commissioner of Fish and Fisheries, 1871-87; trustee of the Columbian University, and of the Corcoran Art Gallery; member of the National Academy of Sciences, 1864, and of numerous other societies, native and foreign. In all these relations, as in private life, Professor Baird proved himself to be one of the wisest, kindest, and most useful men of his day. His early reputation was gained as an ornithologist, but he became eminent for his knowledge in every department of natural history. The National Museum in Washington is a monument to his immense practical ability.
- BARNES, Alfred Smith, in Brooklyn, N. Y., February 17, 1888, aged seventy-one years, one of the most extensive school-book publishers in the world; noted for his Christian philanthropy.
- BATES, Joshua, A. M., LL.D., in Beverly, Mass., June 25, 1888, aged seventy-eight years; educated at Phillips Academy, Andover, and at Middlebury College, Vermont; head master of the Frothingham school, Charlestown, Mass., 1833, and of the Brimmer school, Boston, 1834-76; one of the founders of the Massachusetts Teachers' Association, 1845; a frequent and valuable contributor to the Massachusetts Teacher, etc.
- BERGH, Henry, in New York City, March 12, 1888, aged sixty-five years; a man of excellent education, cultured tastes, and independent fortune, he became famous for his energetic and unceasing labors for the prevention of cruelty to animals, the humane treatment of destitute and friendless children, the protection of game; he organized, and during life was the president of the New York "Society for the prevention of cruelty to animals," an organization that has been copied in every State and large city in this country, and in almost every nation of the civilized world.
- BITTINGER, William, in Abbottstown, Pa., March 3, 1888, aged sixty-seven years; a lifelong merchant, who left valuable legacies by his will to Pennsylvania College at Gettysburg, and to Lebanon Valley College, at Annville, for the endowment of professorships.
- BODLEY, Rachel L., M. D., in Philadelphia, June 15, 1888, aged sixty years; professor of chemistry and toxicology in the Woman's Medical College of Pennsylvania, 1865, and dean of the same, 1877, retaining both places till her death.
- BOOTH, James C., in West Haverford, Pa., March 21, 1888, aged seventy-seven years; an eminent analytical chemist; professor of practical chemistry in the Franklin Institute, Philadelphia, 1836-1844, and in the Philadelphia High School, 1842-45; State geologist of Delaware, 1837-38; melter and refiner in the Philadelphia mint, 1849-88.
- BOVEE, Martin H., in Whitewater, Wis., May 7, 1888, aged sixty-one years; founder of the State boys' reformatory at Waukesha; an ardent opponent of capital punishment.
- BREVOORT, James Carson, A. M., LL.D., in Brooklyn, N. Y., December 7, 1887, aged sixty-nine years; trustee of the Astor Library for more than a quarter century; member of the Brooklyn Board of Education; organizer and first president of the Long Island Historical Society; regent of the University of the State of New York, etc.
- BREWSTER, Henry, in New York City, September 19, 1887, aged sixty-three years; a well-known carriage-builder, whose firm established and maintained an admirable trade-school for the instruction of their employes.
- BROWN, the Right Rev. J. H. Hobart, A. M., S. T. D., at Fond du Lac, Wis., May 2, 1888, aged fifty-seven years; Protestant Episcopal Bishop of the diocese of Fond du Lac, and an indefatigable laborer in the educational affairs of his diocese.
- BULKLEY, John W., in Brooklyn, N. Y., June 19, 1888, aged eighty-five years; taught in Fairfield, Conn., several years, in Troy, N. Y., 1832-51, in Williamsburg, N. Y., 1851-55; assistant superintendent of Brooklyn public schools, 1855-85.
- BUNZL, Julius, in New York City, July 4, 1887, aged forty-nine years; a liberal giver to orphan asylums, hospitals, and schools.
- BURTON, the Rev. Nathaniel J., D. D., in Hartford, Conn., October 13, 1887, aged sixty-two years; a trustee of Yale College; Lyman Beecher lecturer on Preaching in the Yale theological school.
- CARNOCHAN, John M., M. D., in New York City, October 28, 1887, aged seventy years; educated in the University of Edinburgh and in the Paris *École de Médecine*; pro-

- essor of surgery in the medical department of the University of the City of New York; author of standard surgical treatises, etc.
- CARPENTER, Wesley M., M. D., in New York City, January 7, 1888, aged fifty-five years; clinical professor of medicine in the medical department of the University of the City of New York; one of the editors of the N. Y. Medical Record.

- CARO, Elme Marie, in Paris, France, July 13, 1837, aged sixty-one years; professor of philosophy in the Paris faculty of letters; member of the Academy, etc.
- CRAIK, Mrs. Dinah Maria [Muloch], in Shortlands, Kent, England, October 12, 1837, aged sixty-one years; author of *John Halifax, Gentleman* and many other charming stories.
- DE BARY, Anton, in Strassburg, Germany, January 19, 1838, aged fifty-seven years; professor of botany at the Universities of Freiburg, Halle, and Strassburg; specially noted for his researches and publications respecting fungi, bacteria, etc.
- DE CHAUMONT, F. S. B. F., F. R. S., surgeon-major in the British army, in Southampton, England, April 18, 1838, aged fifty-five years; professor of military hygiene in the Army Medical School at Netley.
- DICKSON, Alexander, M. A., M. D., LL. D., at Hartree House, Lanarkshire, Scotland, December 30, 1837, aged fifty-one years; professor of botany in the University of Dublin, 1866; in the Royal College of Science of Ireland, 1867; in the University of Glasgow, 1868-79; in the University of Edinburgh, 1879-87; a copious writer on botanical subjects.
- FECHNER, Gustav Theodor, at Leipzig, Germany, November 18, 1837, aged eighty-six years; professor of experimental physics in the University of Leipzig; virtual creator of the subject of psychophysics, on which he wrote copiously.
- FARRE, Arthur, M. D., F. R. S., in London, England, December 17, 1837, aged seventy-six years; an eminent vital statistician, etc.
- FLEISCHER, Dr. Heinrich Leberecht, in Leipzig, Germany, February 10, 1838, aged eighty-six years; professor of Arabic in the university at that place.
- GIBSON, Miss Jane, in Glasgow, Scotland, December —, 1837, aged 102 years; founder of the Gibson bursaries in the University of Glasgow, and a life-long power for learning and religion in her native city.

- GOLDSCHMIDT, Madame Jenny Lind, in Malvern, England, November 2, 1837, aged sixty-six years; a pupil of the famous music teacher, Manuel Garcia; world-famous as "The Swedish Nightingale," her voice being a soprano of wonderful sweetness, flexibility, and expressive power; for the last thirty years of her life a teacher of music in London.
- GORDON, Alexander, M. R. C. S. I., in Belfast, Ireland, July 28, 1837, aged sixty-nine years; professor of surgery in Queen's College, Belfast, for thirty-eight years.
- HAIRION, Frédéric, M. D., in Louvain, Belgium, August 14, 1837, aged eighty years; formerly professor in the medical faculty of the Catholic University of Louvain, president of the Belgian Royal Academy of Medicine, commander of the Order of Leopold, etc.
- HARNACK, Axel, Ph. D., in Dresden, Germany, January —, 1833, aged thirty-nine years; professor of mathematics in the Royal Polytechnic School at Dresden.
- HOWITT, Mrs. Mary [Botham], in Rome, Italy, February 2, 1838, aged eighty-four years; author of many volumes in verse and prose for the young.
- HUNT, Robert, F. R. S., in London, England, October 17, 1837, aged eighty years; formerly professor of mechanical science in the Royal School of Mines.
- JELLETT, The Rev. John Hewitt, M. A., D. D., D. C. L., in Dublin, Ireland, February 19, 1838, aged seventy years; fellow of Trinity College, Dublin, 1840; professor of physics, 1848; provost, 1881; one of the commissioners of national education for Ireland, 1863; author of several able mathematical works.
- KAHNIS, Karl Friedrich August, in Leipzig, Germany, June 20, 1833, aged seventy-three years; privat docent in the University of Berlin, 1842-44; professor extraordinary in the University of Breslau, 1844-50, and professor in the theological faculty of the University of Leipzig, 1850-83; a well-known writer of Lutheran theological treatises.
- KEY, Admiral Sir Astley Cooper, in ———, England, March 3, 1838, aged seventy-five years; director of the Royal Naval College, which he greatly improved.
- KIRCHOFF, Gustav Robert, in Berlin, Germany, October 17, 1837; born in Königsberg March 12, 1824; educated at the Königsberg University; privat docent in the University of Berlin, 1848-50; professor extraordinary of experimental physics at Breslau, 1850-54; professor of physics at Heidelberg, 1854-74, and the same at Berlin, 1874-87; his discovery, in 1859, of spectrum-analysis made him famous; author of many valuable papers on magnetism, electricity, heat, etc.
- KOSTELETSKY, Dr. Vincent, at Prague, Hungary, August 19, 1837, aged eighty-seven years; sometime professor in the University, and later director of the Botanical Garden.
- LANGER, von Edenberg Karl, M. D., in Vienna, Austria, December 8, 1837, aged sixty-eight years; chevalier of the Austrian order of Leopold; professor of anatomy in the Universities of Buda-Pesth and Vienna, and rector of the latter in 1875-76; author of a Manual of Anatomy, etc.
- LEMAIRE, Pierre Auguste, at Briancourt, France, December 17, 1837, aged eighty-five years; professor of rhetoric in the College of Louis le Grand, Paris; editor of Lucan, Terence, Lucretius, etc.
- LEVI, Professor Leone, in London, England, May 8, 1838, aged sixty-seven years; a well-known author and teacher of political economy.
- LINDNER, Gustav Adolf, Ph. D., in Prague, Austria, October 16, 1837, aged fifty-nine years; professor of philology and pedagogics in the University of Prague.
- LUTHER, Dr. E., in Königsberg, Germany—October, 1837, aged seventy years; professor of astronomy in the University.
- MAINE, Sir Henry James Sumner, M. A., LL. D., K. C. S. I., F. R. S., at Cannes, France, February 3, 1838, aged sixty-five years; regius professor of civil law in the University of Cambridge, 1847-54; reader on jurisprudence in the Middle Temple, London, 1854-62; corpus professor of jurisprudence in the University of Oxford, 1870-83; author of Ancient Law, Village Communities in the East and West, Lectures on the Early History of Institutions, etc.; the first English writer who applied to law and sociology the rigid methods of modern science; he clothed his researches and results in language of singular vigor, lucidity, and grace.
- MANGON, Hervé, in Paris, France, May 15, 1838, aged sixty-six years; professor of engineering in the École des Ponts et Chaussées in the Conservatoire des Arts et Métiers, and in the Institut National; a life-long student of science as applicable to agriculture; Minister of Agriculture in the Brisson cabinet.
- NEUMANN, Spallart, F. X., in Vienna, April 19, 1833, aged fifty-one years; professor of political economy in the University of Vienna, member of the Imperial (Aulic) Council, and Vice-President of the International Statistical Institute.
- PANSCH, Dr. Adolf, in Kiel, Germany, August 14, 1837, aged forty-six years; professor extraordinary of anatomy in the University of Kiel.

- PRICE, Bonamy, M. A., LL. D., in London, England, January 9, 1888, aged seventy-nine years; professor of political economy in the University of Oxford for more than twenty years; author of *The Principles of Currency, Currency and Banking, Practical Political Economy*, etc.
- QUAIN, Richard, F. R. C. S. and F. R. S., in London, England, September 15, 1887, aged eighty-seven years; author of *The Anatomy of the Arteries*, and one of the authors of *Sharpey & Quain's Anatomy*; emeritus professor of surgery in University College; formerly president of the Royal College of Surgeons, etc.
- QUESTEL, Charles August, in Paris, France, in May, 1888, aged eighty years; educated in the *Ecole des Beaux Arts*, in which he afterward became professor of architecture; member of the Fine Arts section in the Institute of France; president of the Central Society of French Architects, etc.
- SCHJELLERUP, Hans C. F. C., in Copenhagen, Denmark, November 13, 1887, aged sixty years; professor in the Danish Naval Academy and in the Copenhagen Polytechnic School; a well-known astronomer.
- SCHUSTER, Dr. Max, in Vienna, Austria, November —, 1887, aged thirty years; assistant professor of mineralogy in the University of Vienna.
- SCOTT, The Rev. Robert, D. D., in Oxford, England, December 3, 1887, aged seventy-six years; master of Balliol College, Oxford; one of the authors of *Liddell and Scott's Greek-English Lexicon*.
- STEWART, Balfour, F. R. S., in Balrath, Ireland, December 18, 1887, aged fifty-nine years; director of the Kew Observatory, 1859-70; professor of physics in Owens College, 1870-87; author of *Elementary Physics, Conservation of Energy*, and other valuable writings.
- TERQUEM, Alfred, in Paris, France, July 17, 1887, aged fifty-six years; professor of physics in the medical school at Lille.
- THRING, The Rev. Edward, at Uppingham, England, November —, 1887, aged sixty-two years; head-master of Uppingham School, 1853-87; author of *Theory and Practice of Teaching*; an eminent educationist.
- TROTTER, The Rev. Coutts, M. A., in Cambridge, England, December 4, 1887, aged fifty years; vice-master of Trinity College, Cambridge, where the teaching of the natural sciences has been largely the result of his labors.
- VISCHER, Friedrich Theodor, in Gmunden, Germany, September 15, 1887, aged eighty years; professor of philosophy at Tübingen, 1837-46, and in the Zurich Polytechnic School, 1856-66; professor of aesthetics at Tübingen, 1866; author of a well-known treatise on *Aesthetics*, in six volumes, etc.
- VON BRINZ, Dr. Alois, in Munich, Bavaria, September 19, 1887, aged sixty-seven years; professor of Roman Law at the universities of Erlangen, Prague, and Munich.
- VON LANGENBECK, Dr. Bernhard Rudolf Conrad, in Wiesbaden, Germany, September 30, 1887, aged seventy-seven years; professor of surgery in the universities at Kiel and at Berlin; surgeon-general of the Prussian army, etc.; one of the most illustrious surgeons of the century.
- WAGNER, E. L., M. D., in Leipzig, Germany, February 10, 1888, aged sixty years; for a quarter century professor of general pathology and pathological anatomy in the University of Leipzig; author of a *Hand-book of General Pathology*, 1862, etc.
- WERNER, Gustav, in Reutlingen, Germany, August 2, 1887, aged about seventy-eight years; founder of manual labor schools and workshops for the training, employment, and care of blind, crippled, and destitute people.
- WINTER, Georg, Ph. D., in Leipzig, Germany, August 16, 1887, aged thirty-nine years; professor of botany in the University of Leipzig.
- WROBLEWSKI, Dr. Sigismund, at Cracow, Poland, April 16, 1888, aged fifty years; professor of experimental physics in the university, 1882.

I.—REPORT ON THE SITKA INDUSTRIAL TRAINING SCHOOL.

SITKA, ALASKA, *June 15, 1889.*

Hon. N. H. R. DAWSON,

Commissioner of Education, Washington, D. C.:

DEAR SIR: At a meeting of the Territorial board of education, held last January, at which were present Messrs. Swineford, Sheakley, Duncan, and myself, I was instructed by a unanimous vote to investigate the industrial features of the mission school maintained at Sitka by the Presbyterian Board of Home Missions, and to the support of which the Government annually makes contribution, and to report the results of my investigation to you in writing. Before entering upon that duty I addressed to you a note stating the scope and purpose of that vote and suggesting a hesitancy on my part without your direct approval, which I am pleased to state was given.

Permit me also say that the investigation was ordered by the board of education because William Duncan, Esq., a member of the board, made statements in one of its sessions that some of the pupils in the institution, sent by him from Metlakhatla on Amelia Island, complained to him that they were not given any industrial training—properly speaking, that the sanitary condition of the institution was very imperfect, and that the food was of an improper character. I was accidentally present at an interview between Mr. Duncan and seven or eight of the young men sent by him to this school, and know from what transpired in that interview between him and them that whatever the facts were, at the time he acted in the utmost good faith in bringing the matter to the attention of the board. When here, on that trip of the steamer, I personally know the fact that he removed two young men to their homes on Amelia Island, who were quite seriously ill and threatened with pulmonary disease, contracted, as they represented, by unnecessary exposure in procuring wood rafts for fuel for the institution.

Allow me to say at the outset that I accepted this delicate task with the greatest possible hesitation, because it is difficult in investigations of this kind to avoid the imputation that improper motives have entered into any conclusions which have been reached. I think, since my arrival here and my participation officially in the educational affairs of the district, that I can truly say that not a single act of mine has been prompted other than by the most earnest desire to secure to the public the best possible results from the large expenditure which the Government is annually making for the support of general and industrial education among the natives of Alaska.

The Bureau of Education, yourself particularly, by personal observation, is already familiar with the location, character, and the extent of the grounds and buildings occupied and used for mission and educational purposes at Sitka. I may be permitted, however, for a fuller understanding of what follows herein, to restate that matter. The bay of Sitka at the southwest angle of the town site, extends eastwardly and southeastwardly, the shore line, on the north side of that portion of the bay, forming the arc of a circle. The enclosed grounds of the mission rise gently toward the north and the northeast from this shore line, and the main buildings of the institution are upon an elevation of about thirty feet above sea level. A roadway from the town of Sitka to Indian River, about a mile distant, separates the mission grounds from the beach. The main buildings are about one hundred and fifty feet from the north limits of the roadway. The main buildings have a south frontage, facing the bay. There are two large frame buildings within that enclosure and on that eminence, used by the institution. The western one of these is about one hundred and fifty feet long, from east to west, and is used by the officers and teachers of the institution for dwelling purposes, and also as dormitories for the pupils. Like all buildings which I have seen in southeastern Alaska, this one is unplastered. Many of the rooms, especially those occupied by the officers and teachers, are properly lined with building paper, and thus made quite comfortable, but I observed that the dormitories for the pupils were not so lined and finished. The sleeping places of the pupils are quite large rooms, fitted with plain deal single cots, and the bedding seemed neat and clean.

Several hundred feet southeast of the building just mentioned is another of the same

ground dimensions, similarly built, and three stories in height. The two are connected by a wooden covered way. The latter is divided into class rooms, dining halls, chapel, and dormitories, and is quite a comfortable structure, and in its plan well adapted to the designed use.

In the rear of these are several smaller wooden buildings used as a laundry, bake-house, and other similar necessary purposes. On the southeast side of the roadway to Indian River, and beyond the mission enclosure, about three hundred yards from the easterly main building, is a substantial one story and a half frame building about seventy-five feet long and forty feet wide, known as the industrial building. Its rear abuts directly upon the beach at that point. The first floor is called the carpenter and cabinet shop, and the second floor is called the shoemaker's shop. A few feet to the east of this is a very small structure made of rough boards, known as the blacksmith shop. It only has one fire, and the accompanying set of tools.

One hospital building is situated upon a rising piece of ground several hundred feet from the beach and east of the road to Indian River. Its location is as healthful as can be selected in Alaska. It is a one and a half story frame building about one hundred feet long and forty feet wide; the interior arrangements are excellent and appropriate. A competent physician and surgeon and a skilful nurse or matron are employed by the board of home missions, and constitute a portion of the staff of the institution.

The board of education in the fall of 1888 called the attention of the management of the mission to the fact that the sanitary condition of the buildings and grounds occupied for residence and school purposes could not be satisfactory until a large tundra swamp about twenty rods in rear of these buldings was properly drained by drawing off the accumulating water into the bay. A ditch has been partially completed since that across the west end of the mission grounds, intended to effect this drainage. Attention was also called at the same time to the imperfect condition of the sewerage leading from the main buildings to the point of discharge on the beach. There is now no means of flushing this sewer, and the result is that poisonous and most offensive gases in great quantities are given off, certainly making the vicinity disagreeable and unhealthy and an absolute nuisance to the public compelled to pass this sewer where it crosses the road to Indian River. When the attention of Dr. Jackson, of the institution, was then called to the matter he represented to the board of education that such a change was contemplated by the management as would render this sewerage from the buildings inoffensive by providing water from the Indian River for the purpose of flushing. The cost, not a great deal, to conduct the water from Indian River had been estimated, he stated, and the only obstacle to the making of the improvement was the present lack of funds.

I respectfully urge that the Board of Home Missions in its contract with the Government has entered into no more important and serious obligation in regard to the pupils whose industrial tuition, lodging, and feeding are at some public expense than that in relation to the health of those young people under its care at this institution. This condition of things existed last year. The summer is quite well gone and the sewerage remains the same. It is a duty which the Board of Home Missions owes the Government, as well as the pupils themselves, that the horrid stench and effluvia which arise from this sewer, or simply covered trough, be prevented by the expenditure of the moderate amount estimated by the management here necessary to do so. There has been long enough delay in the matter. The example itself is an unfavorable one to natives whom we are endeavoring to instruct in habits of cleanliness.

I come now to the industrial features of the institution. The third section or paragraph of the contract made by the Government with the officers of the Presbyterian Board of Home Missions, dated July 1, 1888, and to continue for one year, makes some distinction in relation to the obligation of industrial education as the sexes are divided. For the purpose of a better understanding of this report, I shall keep my statements and suggestions in regard to industrial education as provided in that paragraph distinct, as they relate to the two sexes. The contract provides that the Board of Home Missions shall provide a sufficient "number of properly qualified employes to instruct the male pupils of said school in gardening and farming and care of stock; to instruct certain of the male pupils (the number to be determined upon agreement with the party of the first part) in mechanical trades, said trades to be designated by the party of the first part; to instruct the female pupils in cookery, laundry, needlework, and general housewifery; and to teach the pupils the ordinary branches of an English education."

It will be thus seen that the classification of duties and obligations relates first to the male pupils. The provision in relation to "gardening and farming and care of stock" is in part impracticable of execution.

It is true that not all, or very many, of the food vegetables common to the gardens in most of the States can be raised here under ordinary conditions. There are quite a number of root crops, however, such as potatoes, beets, a kind of turnip, lettuce, and cabbage in most seasons, which can be successfully cultivated in gardens, and have been so cultivated by the Russian and creole population of Sitka and the adjacent islands. I

have carefully examined respecting what has been done by the mission management toward experiments in gardening, and I cannot find that any attempt has been made in that respect. The mission has been in existence for many years, and the success in the cultivation of the vegetables I have named has been demonstrated in Russian gardens in existence before the transfer of the Territory to the United States. Land available for gardening has always been easy of access, and not difficult to fit and prepare for that purpose. In fact, several islands upon which flourishing gardens exist belonging to private parties have only recently been appropriated by the latter which might have been secured to the mission for the same purpose. The conditions are not ripe for general farming and stock-raising in Alaska; whether they will ever exist I cannot say, but from what I have carefully observed in regard to what the Russian and the American residents have accomplished for years, in gardening, I have no hesitancy in saying that if a similar contract is entered into with the Board of Home Missions for the fiscal year 1889 it should contain a stipulation requiring the male pupils at least to be instructed in gardening and requiring the mission authorities to make a commencement in that direction. Great as are the food resources of these native people in the waters of Alaska, the time is not far off when it will be greatly diminished and made more difficult to procure. Capital in new canneries is rapidly accumulating, and while these afford employment for a portion of the year to large numbers of the natives their direct tendency is to diminish the supply of food to the natives eventually. The most important step in their civilization and industrial education, especially in view of what I have said respecting the possible failure of their accustomed food supply from the water, is to teach them the benefits of diversifying their food and the means of doing so. I deem this matter so important, in view of the neglect heretofore, that I would suggest the temporary abandonment of all other summer industrial education of the male pupils until this question of gardening was settled and fixed definitely. The land will cost nothing but the labor of clearing it. Some of it is cleared enough to make a beginning already. The Government will supply the seeds, as it supplies many private individuals here now. I desire to press this suggestion, because I have never heard a satisfactory excuse for the delay. It was suggested in the annual report of last year that the Department of the Interior take the initiative in establishing a model farm here, that experiments, among other things, might be made to demonstrate what useful crops might be most successfully and profitably grown in Alaska. I concurred in that report at the time, but it was without due reflection, and it was also due to the further fact that my residence in the Territory had been so short that my opportunity for accurate observation was not such as it has since become. I am free to say that I have revised that opinion and am now clearly convinced that the proper thing to be done is to insist on gardening as the principal object of industrial education for the male pupils at the institution under its contract with the Government.

I do not regard the blacksmith shop a real factor in the industrial education of the male pupils. There is really no blacksmithing in and about Sitka, to amount to anything, giving opportunity to exercise that trade either as an apprentice or pupil or as a journeyman. There are no draught animals on the island, except one pair of mules belonging to the institution and three or four others at Tilton Bay, twelve or fifteen miles south of this, where they are employed for packing purposes. There is not the work and the materials or the demand for the finished product to justify spending any time in that department. The only possible way to educate the young male natives in that handicraft, so that they might earn a living thereby at the various mining establishments rapidly developing in Alaska, is to send them to the States and Territories where they will have an opportunity to serve an apprenticeship that will result in their acquiring a knowledge of the craft.

An instructor in shoemaking is employed by the mission. Not more than a dozen of the eighty-four boys are at work in the shoeshop endeavoring to learn that trade. The natives here are rapidly taking to shoes and abandoning the deerskin moccasin, though many of them are still worn. As the native becomes more advanced in civilization he affects the white man's dress, and now they are important customers to the traders and storekeepers in the matter of ready-made shoes. They are shrewd enough to understand that as well as the whites. I think the most important result, therefore, of the shoemaking department of the institution is the instruction, if properly imparted, in the art of repairing. The natives are large customers of the dealers in rubber goods, and especially boots. The first money they save goes to the purchase of rubber boots, made necessary by their modes of gaining a livelihood by hunting, fishing, cutting and selling wood, etc., and a necessity that will always exist, owing to the peculiar conditions of soil and climate of southeastern Alaska.

While there is a carpenter shop, as I have already mentioned, there is no regular instructor employed in that branch, and as it exists now I do not regard it of any practical value whatever. Five or six cottages have been erected during the past three years on grounds contiguous to the mission by natives, and occupied by them, but there is prac-

tically little instruction of the present classes in the school in that art. Two small houses were erected in the Indian village, or ranche, as it is called, during the past ten months by native skill, by natives living in the village itself. There has been no other opportunity for instruction in house building on the island during that period.

Several of the bright, intelligent native boys at the institution have been instructed as bakers, and do the baking of the mission, and that quite well. When I come to the industrial training of the female pupils I will allude to that subject again.

One of the points of the resolution ordering the investigation which is the subject of this special report was a specific direction that I should advise the management of the mission to desist from the employment of the male pupils in the hazardous task of going off to distant points in inclement weather to prepare log rafts for fuel for the institution, and then when these rafts are brought to the beach near the mission, requiring these pupils to saw and split these logs for use. The manner in which the fuel is procured is this: Available timber near Sitka for that purpose, owing to the long settlement here, is becoming scarce. Groups of these boys and young men are sent out in boats ten and fifteen miles distant to cut logs, get them into the water, put them together into rafts, and then work the rafts up the bay to the beach near the mission for use as fuel. After the rafts are towed in in that way they are broken up, and then the boys are set to work with cross-cut saws to saw them into proper fuel lengths, which is done, and they are also split into proper sizes. Many of these logs are of great length and thickness, and owing to the difficulties of the situation require the labor of hardy, stalwart men, accustomed to that kind of labor, to get them from their places in the woods to their places in the proposed rafts. These rafts have to traverse quite a distance of open sea, and the task is thus hazardous. The labor of sawing and splitting these logs on the beach, often as they are buried in the wet sand of the receding tide, is of the most exacting kind, and owing to the inclement weather prevailing here for the greater part of the year is certainly deleterious to the health of young persons confined to the warm school-room a great part of each day.

Permit me to illustrate this matter from an example. Last fall, the last of October, about a dozen of young men were started out from the mission some ten miles along the coast of this island to cut logs and construct a wood raft for fuel and to bring it in. They were in charge of a white man belonging to the institution. They camped out for four weeks in the timber along the beach and cut and got into the water enough of yellow cedar and spruce logs to build a raft of the estimated capacity of four hundred cords of wood. The raft was completed and ready for departure when a violent storm arose, the raft went to pieces in the open sea, every log cut and put into the water was utterly lost, and the young men who had expended their time and labor for weeks narrowly escaped with their lives.

While it is very important that the male pupils be employed in some manual labor during each week day, I am convinced that this practice of providing fuel for the institution in that way should be abandoned. I am also aware of the difficulty which the Board of Home Missions encounters in procuring funds for the extended and important work in which it is engaged, the mission work in Alaska included, and of how much a burden the cost of purchased fuel would be; but in my opinion, when we consider the health of the male pupils here, it is a far less serious matter than that of the present method of getting wood in rafts by the arduous labor of these young men. When the board of education took action in the matter the four members present agreed with perfect unanimity that the interest which the Government has in the welfare of these pupils demanded the abolition of the plan of supplying the institution with fuel with rafts secured by their labor as I have described.

In the brief annual report which I had the honor to make to you, concerning the general educational condition in Alaska during the past year, I suggested the propriety of Government aid in the erection of a steam saw-mill of moderate capacity in conjunction with such machinery, at a modest expense, as would constitute a plant for the manufacture of lumber for the market here by the labor of these industrial pupils, and for the manufacture of packing cases for the numerous salmon fisheries of southeastern Alaska. Mr. Duncan, at Metlakhatla, is pursuing this course in the industrial training which he is giving the people of his settlement. I know that he has been able to secure quite large contracts for supplies of that kind, the benefit of which inures to the natives of that village. I renew and urge this consideration.

I desire now to call attention to the industrial education of the female pupils, under the terms of the contract, a portion of which I have already quoted. An honest effort is being made by the managers and teachers of the institution to instruct these pupils in the ordinary duties of housewifery. One great difficulty is the lack of teachers. What I mean by that is that the teachers are too few for the number of female pupils, considering that the task begins with teaching them to speak English, and then is continued in the instruction of an ordinary English education, and in the industrial training provided in the contract. I find that a steam laundry is attached to the institution by which all

the laundry work, including that of the pupils, is done. I regard the maintenance of this piece of machinery a serious mistake. There is no branch of female duty in which these natives require more urgency in instruction than that of cleanliness of person and clothing. Among the native women of the village here the primitive method of washing clothing and blankets obtains almost universally. That is, they go to a small millstream in the outskirts of Sitka in groups of eight or ten, even in midwinter, once a week, and, entering the water, wash their clothing and blankets by rubbing them upon the bowlders of the stream. It is no uncommon thing to see such a group, entirely barefoot, standing in this water, which has just left a glacier not two miles distant, and when the mercury is to freezing point. The girls at the institution are not taught this essential of domestic duty except in theory and by precept. What they want are tubs and wash-boards there for the use of these girls in actual instruction. When they marry and have homes of their own, as is expected, they are not likely to have either servants at hand or steam laundries as part of the household outfit.

I have already spoken of the fact that the baking is done by a small group of boys. I have no criticism of that, so far as it is intended to give those male pupils the means of earning a living in the future in that way; but it seems to me that while female pupils are to be industrially educated in the same institution, it is far more important that they should be thoroughly taught those matters which appertain to their own sex, especially in view of the fact that they will be wives and mothers among the working classes of Alaska for some years to come, than that some of the male pupils should become experts in that branch. The female pupils are making commendable progress in learning to sew. The fact is, that these native women are apt in learning anything of that kind, and the most important thing then at the institution is to ingrain these things as indelible habits.

I think more teachers are needed in the girls' industrial department, and that all the chamber work, all the washing and ironing of clothes, and the plain baking should be done by these girls; this is not important for the purpose of making domestic servants of them, but that they may take their proper places at the heads of native families to which they are destined by nature and circumstances.

The zealous and competent ladies who have come from the States to engage in the laudable work of Christianizing and civilizing the natives of Alaska are doing all that energy and zeal can accomplish in the way of teaching the pupils the English language and the rudiments of an English education, together with a diligent effort at improving their moral condition. The entire management of the institution deserve great credit for what has been accomplished in those directions. It is not my province, in this report, to do more than speak incidentally of the mission work proper of the institution, and then only as it has its influence in shaping character, in connection with the English education which the contract requires to be imparted to the pupils. I have had numerous opportunities of observing the deportment of both the male and female pupils out of school hours, and during their Saturday holidays, and nothing can be more commendable than theirs is always.

I may say here, that a brass band of fifteen pieces was organized among the male pupils, about six months ago, under quite a competent white instructor, and it is really astonishing the aptitude and skill the young men exhibit in this accomplishment. It is a pleasant diversion to those who play, but it is also a refreshing entertainment to the pupils at large. Its effects are, apparently, excellent.

Permit me to make another general suggestion in regard to control of the industrial department. It has been mooted as to the propriety and necessity on the part of the Government to provide an assistant to the general agent of education, who also has an official connection with the mission itself: After a careful consideration of the matter I have come to this conclusion: An assistant should be provided, but he should have no official connection whatever with the Presbyterian Board of Home Missions, nor with any other of any other denomination. He should be assigned to duty at this industrial school, and every industrial interest attached thereto should be intrusted to his management, and he should be responsible alone to the Government for his acts, methods, and conduct. On the other hand, he should have no power in the slightest degree to interfere with the mission work proper of the institution, or with its general educational features, except in regard to the latter as an inspector. Between him and the mission authorities the time could be so divided that the industrial instruction and management would not interfere with the mission and educational work proper, and in case of disagreement the Territorial board might act as an umpire and arbitrator.

The fact that during this fiscal year the Government is paying to the institution the considerable sum of \$12,500, with the prospect of continuing this wise liberality for some time to come, impels me to urge the considerations which I have already stated herein. All the conclusions I have reached are after months of patient investigation and careful reflection.

I desire to make an observation in relation to the employment of teachers. I do not

think that the best judgment has been exercised in that respect, considering the lapse of time. I do not think that the proper effort has yet been made to educate native teachers, and that the work will be retarded to the degree that this matter is delayed. All of the pupils come to the mission with a knowledge of their own native dialect. These people are shrewd and apt and early learn to think, and to think in their own language. The Greco-Russian Church maintains a mission school at Sitka, and, for the purposes of comparison, I have studied its methods. It employs teachers who are not only thoroughly acquainted with Russian and English, but with the Thinklet tongue. The pupils are making quite rapid progress in English through the teacher's ability to make his explanations in the dialect which they have learned at home.

Those who for years have been making this highly commendable and necessary effort to civilize the natives through the mission and industrial school at Sitka have had natural obstacles in their way not known in any other locality where Indian instruction and education are carried on. The climate in many respects is very severe; the soil is not adapted to extensive farming, as it is on the Indian reservations in the States and Territories. There is, therefore, no middle ground in a pastoral, cattle-raising life between the original native methods of procuring a living from the waters and the forest and their ultimate destination in civilization, as in the case of the "Plains Indians" passing from their nomadic career of buffalo hunting to what the Government hopes to accomplish. The rough, rugged nature of the country in Alaska, the almost impassable mountain barriers which hug the coast from the national boundary on the south and far to the westward, render it impossible to remove the pupils during their period of training from the immediate vicinity of the places where their parents and kinsmen earn their living by the primitive methods of fishing and hunting. This is daily in their sight, and constantly keeps alive the tendency to revert to the native customs, habits, and usages. It requires the greatest possible courage, patience, and intelligence to overcome these constantly recurring obstacles. These virtues those engaged in the work have.

What I have said in this report has not been for the purpose of obstructing their work on any of its many sides, but to point out the means by which the object of it all can be accelerated, according to the judgment I have reached after a careful observation of the situation and circumstances.

In conclusion, permit me to thank you for the kindness and consideration I have received from you since our official intercourse began in the interesting and important work of education in Alaska.

Yours, very respectfully,

JNO. H. KEATLEY,
Pres. Board of Education.

II.—ADDITIONAL DIGESTS OF STATE SCHOOL REPORTS.

[Addenda to Chapter IV.]

Below are given summaries of those State School Reports which were not received in season for use in the preparation of Chapter IV.

COLORADO.

[From Report for 1886-87 and 1887-88 of State Superintendent Leonidas S. Cornell.]

STATISTICAL SUMMARY. a

	1886-87.	1887-88.	Increase or Decrease.
POPULATION AND ATTENDANCE.			
Population of school age (6-21).....	65,216	76,212	I.....10,996
Number between 6 and 16 enrolled.....	33,601	45,293	I.....6,692
Number between 16 and 21 enrolled.....	4,300	5,452	I.....1,152

Expenditure per capita of average attendance.....	31.86	36.57	I.....4.71

a Some of the statistics contained in this summary differ slightly from the returns made to the Bureau of Education.

GENERAL STATEMENTS.

During the two school years, 1886-87 and 1887-88, a great advance was made in the condition of the public schools in all parts of the State. Not only was there an increase in the number of schools, but they were of a better grade. There was a very considerable increase in the school population, enrolment, average attendance, and in the expenditures for school purposes. A much wiser and more liberal policy was pursued in the erection and furnishing of school buildings than in former periods. Endeavors were

made to secure the establishment of a definite and uniform course of study, which would certainly be of great advantage.

HIGH SCHOOLS.

In quite a number of places efforts have been made to establish high schools, but there are some serious difficulties in the way. In a majority of the towns and villages there are not a sufficient number of high school pupils to justify the establishment of schools independent of the lower grades. All the high schools should, if possible, be made of a sufficiently high grade to prepare students for the State university. Another difficulty is that although the law has authorized the establishment of union high schools, it has made no provision for the erection of the buildings nor for the maintenance of the schools by taxation.

SCHOOL-HOUSES.

During the year 1887-88 one hundred and thirty-four school-houses were erected. Many of them are large, elegant buildings, arranged with special reference to school purposes. The school buildings of Denver are equal to any either in the East or West. During the last two years splendid school buildings were erected at La Veta, Las Animas, Colorado City, Manitou, Monte Vista, and other towns. School boards should make no mistakes in the construction of school buildings in these days when the most approved plans may be had at very little cost.

ENROLMENT.

Only 66 per cent. of the school population were enrolled in the schools, and in some of the counties the percentage was less. This is a feature much to be regretted, and which should be remedied if possible. A law for compulsory school attendance would probably diminish the evil to some extent.

TEXT-BOOKS.

By a recent enactment of the Legislature, school districts are permitted to furnish all their pupils with text-books at the expense of the district. Quite a number of districts have availed themselves of this privilege, and the plan is found to meet with general approval. One of the great advantages is that it at once secures uniformity of text-books.

LIBRARIES FOR SCHOOLS.

The law authorizes the school boards to levy a tax of one-tenth of a mill for library purposes, but in only a few districts has it been done. The benefits to be derived from school libraries are so great that the districts should at once begin to establish them.

TEACHERS.

Hundreds of teachers from the Eastern States, attracted by the healthful climate and the high salaries, have sought homes among the mountains of Colorado, and many of them who had lost their health have regained it. In this way Colorado has become well supplied with excellent teachers. Many letters are still received by the State superintendent from teachers in the East who desire to change their location.

The law provides that teachers' examinations shall be held on the last Fridays of February, May, August, and November, and at no other time. The questions are prepared by the State superintendent, hence the examinations are uniform as regards both the questions and the times of examinations. Examinations for State certificates are held once every two years, but only a few persons undertake them.

STATE SCHOOL FUND.

"The amount of permanent school fund in hands of the State treasurer November 30, 1888, was \$488,684.85; amount due on deferred land payments, \$112,507.20; making a total to the credit of the State of \$601,192.05.

"The revenue derived from permanent fund as interest and the rentals on school lands have amounted during the past year to a fraction over two dollars *per capita* for all persons of school age, or the sum of \$143,141.70. Such an amount as this brings a much-needed aid to the school work, and reduces in a measure the rate of taxation."

CONNECTICUT.

[From Report for 1887-88 of State Superintendent Charles D. Hine.]

^aSome of the statistics contained in this summary differ slightly from the returns made to the Bureau of Education.

EXAMINATION OF THE SCHOOLS.

The board of education determined not to rely simply upon the statistics of the number of children enrolled and in average attendance, the number of days the schools were in session, etc., but to make a thorough and practical examination of the work being accomplished in the public schools. As this could not be done throughout the whole State, it was decided to make the investigation in New London County, which contains two cities, two boroughs, agricultural, mining, and maritime districts, and is therefore fairly representative of the different social and industrial conditions of the State. Every school in this county in session during the time of visitation was inspected by one or more agents of the board, who made inquiries as to the ages of different pupils and the length of time they had attended school, and then examined them in different studies to see what progress they had made. These examinations showed that there were many excellent schools in which the pupils made rapid progress and fully comprehended their studies; but in others the reverse was true.

COMPARISON OF CITY AND COUNTRY SCHOOLS.

In the cities and large manufacturing towns where there are large numbers of foreign-born children attending the schools, liberal appropriations are made for schools, buildings specially adapted to school purposes are erected and furnished with everything needed, the best teachers are employed, and the schools are kept in operation a full term. The children of ignorant, foreign-born parents, knowing little or nothing of the English language, enter a kindergarten attached to one of these schools when only four or five years of age; they continue to attend school until twelve or fourteen years of age when they begin work for themselves. During this time they have learned to speak and read the English language fluently, and have learned to write well; they have learned much about American history and institutions; by the study of geography they have become acquainted with the location of different countries, and with the manners, customs, and conditions of their inhabitants; they have learned enough in arith-

metic to answer all ordinary purposes; they have had instilled into them good moral principles; in brief, they have become bright, intelligent, and fully equipped for life's duties.

But so favorable a report cannot be made when we come to consider the rural schools, where we find the children of the old Connecticut families that have had a part in making the history of the State and in establishing its institutions. The houses in which these schools are taught are old, dilapidated buildings, many of them unfit for use at all; the number of pupils is small, one hundred and ninety-three schools having eight pupils or less; the teachers are inferior to those employed in the cities and large towns, and the school terms are short. It was found upon examination that about two-fifths of the children in these schools above ten years of age could not write, although most of them had been attending school from three to five years. In one hundred and twelve of these schools the old alphabet method of teaching the letters is still in vogue. The progress made in arithmetic also was very unsatisfactory. The board of education has reported these facts just as they found them, "trusting that the people of Connecticut, who assuredly have not lost their attachment to its common school system, will not rest until a remedy is found."

NON-ATTENDANCE.

It was found that there was much irregularity in the attendance of pupils, and that many children of the age for compulsory attendance were not complying with the law. This is attributable in part to the fact that school visitors are unwilling to engage in the unpleasant task of forcing pupils to attend school, a task for which they receive no pay, and which is liable to render them obnoxious to their neighbors.

About eleven per cent. of the delinquents did not attend on account of their mental or physical condition; in some cases the parents were unable to furnish suitable clothing, but "by far the larger number of cases were attributable to laziness, shiftlessness, or drink." It is thought by the State board that the law should entirely forbid the employment of children under sixteen years of age during the sessions of schools, until they can furnish a certificate from proper authorities that they can read, write, and cipher; but children between the ages of fourteen and sixteen might be employed, provided they attend an evening school.

SCHOOL BUILDINGS.

A large number of the school buildings were in need of repairs, or were entirely unfit for use. In New London County alone there were fifty school buildings reported in an unsuitable condition. The variety of desks was very great. Forty-three schools were supplied with new single desks.

TEACHERS.

A great hindrance to successful work in the schools is the frequent changing of teachers. Many schools have a new teacher every term. Of the 182 teachers in New London County, 113 were teaching their respective schools for the first year.

Many of the teachers employed were too young to have charge of schools, and had undergone no special training for the business. But few male teachers were employed.

The examinations of teachers are very unsatisfactory. They are not tests of education, much less of ability to teach. In the employment of teachers other considerations than the welfare of the schools frequently determine the choice. Sometimes a teacher is selected simply because she has been unfortunate, or is in bad health; but more frequently because she is a relative or friend of the committee. Sometimes political or religious influences determine the appointments.

Many of the teachers have never seen a well-conducted school, and consequently do not know what a good school is. If the young teachers were required to spend a certain number of days in the year in a model school like those connected with the State Normal School, they would acquire much valuable information which would greatly enhance their efficiency as teachers.

PRIVATE SCHOOLS.

Some of these were established because of a desire on the part of parents to keep their children separate from the common masses; others on account of dissatisfaction with the management of the public schools, or dislike of teacher or committee.

In some cases the withdrawal of the children of intelligent and cultured people has resulted in deterioration of the public schools.

ILLINOIS.

a Some of the statistics contained in this summary differ slightly from the returns made to the Bureau of Education.

LOCAL MANAGEMENT OF SCHOOLS.

A prominent feature of the school system of Illinois is the almost entirely local control of the schools. Every township has a board of trustees which determines the boundaries of the different districts, and appoints the township treasurer through whom is distributed the amount of money received by the township from the State fund. They also have control of the township high schools.

But the district directors are the most important school officers. They elect the teacher, determine the teacher's salary, decide what studies shall be pursued, what books used, and what amount of money shall be expended for all purposes except what the law says shall be determined otherwise. In the selection of a teacher, however, they must limit themselves to those persons who have been approved by the county or State superintendent.

POWER OF THE STATE SUPERINTENDENT.

Although the State superintendent is placed at the head of the public school system, the law has invested him with very little power. He can require reports to be made to him by the county superintendents and other school officers, and can withhold from

any section which has not complied with the school laws its proportion of the State school fund. Beyond this, he must rely upon his own efforts and personal influence for accomplishing any purpose. He can be of great assistance, however, by visiting the schools in different parts of the State, conferring with county and city superintendents and other school officers, arranging for teachers' institutes, and collecting and publishing the school statistics.

SCHOOL DISTRICTS.

In the opinion of many of the best educators of the State the interests of the schools would be subserved by making the school districts correspond with the townships. In objection to this, it is stated that there would be too great a centralization of power, and that the present system requires a large number of school directors who receive much information in the discharge of their duties. The improvement of these officers, however, is of much less importance than the interests of the common schools in which over a million children are receiving instruction.

REVISION OF THE SCHOOL LAW.

By a joint resolution of the thirty-fifth General Assembly, the State superintendent was intrusted with the work of revising the laws relating to the public schools. He was assisted in this work by four prominent men of the State, three of whom were engaged in educational work. About sixteen years had elapsed since the last revision, during which time many additions and repeals had been made; moreover, the laws were placed together without any regard to system or to the subject-matter. In order to ascertain the duties of the State superintendent it would be necessary to examine all the school laws, for many provisions relating to him were to be found where they might be least expected. According to the arrangement made by the State superintendent and his assistants, the law consists of sixteen different articles, each relating to a different subject. Each article is subdivided into sections which contain all the provisions of law relating to that subject.

COMPULSORY EDUCATION.

There is already a statute which was designed to secure the attendance of children upon the schools, but it seems to be entirely inoperative. It is doubtful whether it has secured the attendance of a hundred pupils who otherwise would have remained at home. If the ill effects and dangers which follow illiteracy are so great as to necessitate the expenditure of millions of dollars to prevent them, then they are also great enough to obligate the State to see to it that all the children are attending either a public or private school, or have satisfactory reasons for not doing so. An examination of the statistical tables of 1888 shows that after deducting the number of children in attendance upon public and private schools from the total number of children who are between six and twenty-one years of age, there is a balance of 266,658 children not attending any school. It is true that many of these have already secured a fair education and that many others are justifiably absent, but it is quite probable that there are many not embraced in either of these classes.

In Massachusetts, truant officers, who receive a regular salary, are appointed for the special purpose of looking after the youth of school age and seeing that they attend school. In other States children of certain ages are not allowed to be employed in mills or factories. It would not be well for Illinois to adopt such measures too hastily; it should first be seen what can be accomplished by moral influence and by the awakening of a greater interest in education, and such children as cannot be reached in these ways should be made to feel the influence of the law.

HIGH SCHOOLS.

In 1867 the people of Princeton secured the enactment of a law authorizing the establishment of a high school at that place. The school has been very successfully carried on ever since, and Princeton has become an educational centre. Other towns, seeing what had been accomplished there, undertook similar enterprises, and in 1879 a general law was enacted authorizing the establishment of high schools.

Public education should not be limited to the primary elements of an education. In former times a person who could read and write enjoyed quite a distinction, but that time has passed. At the present time unless a person's education embraces more than the ability to read, write, and cipher he is not fully prepared to compete with his fellow-men in the struggles of life.

High schools serve as a stimulus to pupils of the lower grades; for, even if a boy does not care to prepare himself for a high school course, his fellow-students are doing so, and he endeavors to keep step with them. High schools also save parents the expense of sending their children off to boarding schools, by furnishing them the means of higher education in their own township.

MORAL TRAINING.

It is more important that children should be able to discriminate clearly between right and wrong, and that there shall be instilled into them an admiration of what is right and a hatred of what is wrong, than that they shall be intellectually trained. Men will respect the honest and industrious laborer although he may never have entered the door of a school-room; but they will condemn and despise the man who has become so debased as to look with the same feeling upon right and wrong conduct.

Moral instruction cannot be given best from a text-book on the subject. The strongest influence in this direction is that of the teacher's personal character. "Moral health is contagious as well as moral disease. If the teacher shows in his dealings with his pupils that he is animated by the desire to do justice; that he is honest; that in thought and speech and act he is pure, and that in his heart he wishes well to all about him, then the pupils will be likely to take on these virtues. They will be likely to form habits in conformity with the ideals presented; and we know that habits at last become a part of the soul itself. They are inwrought into the very being." The influence of the teacher will be greatly increased if the pupils know that he is a man of much ability, and especially if they know that he appreciates their circumstances and is in sympathy with their feelings. The examples of good and illustrious men and women may be used to impart very effective lessons in morality.

MANUAL TRAINING.

This subject is now receiving much attention, and several manual training schools have been established, among the most successful of which is the Chicago Manual Training School, which is supported by the Commercial Club. Manual training has also been introduced with success into the public schools of Moline and Beardstown. The establishment of institutions for such instruction is very desirable.

It is doubtful, however, whether it should be introduced into all the schools or even into all the grammar schools in the cities. It will very probably not prove to be the panacea for educational ills which its enthusiastic advocates seem to expect; but, on the other hand, it is worthy of careful consideration.

ARBOR DAY.

By an act of the Legislature, approved June 10, 1877, it is made the duty of the Governor in each recurring spring to designate a day, to be known as Arbor Day, which is to be observed by the planting of trees, shrubs, and vines about the homes and along the highways, and about the public grounds within the State. The wisdom of such a measure will not be questioned in Illinois, where the value of trees was recognized by the first settlers, and where the planting of them has been so long encouraged.

GENERAL CONDITION.

The public school system of Indiana was established by men of broad and liberal views who were fully impressed with the importance of educating the youth of the State, and hence it has never been found necessary to go back and re-establish the system upon a new basis or upon a different plan. But whenever it has been found that an improvement could be made, there has been no hesitancy in adopting it. Thus, the old district system has given way to the more efficient township system, and county examiners have been superseded by county superintendents.

Notwithstanding the great decrease in the assessed value of real estate, the schools have suffered no decrease in the length of terms, and there has been an improvement in the condition of the primary schools. This improvement is due in large measure to the higher qualifications of the teachers, who have associated themselves together in reading circles for the purpose of carrying on a systematic and professional course of reading. In the smaller towns and villages, however, on account of the selection of incompetent and inexperienced teachers from political or social reasons, the schools have not progressed so well.

The uniform course of study for country schools which was adopted by the State convention of county superintendents in 1884 has proved to be of immense benefit to the schools, and when a few modifications found advisable shall have been made, the schools will have a definite and regular course laid out for pupils during each year of their attendance.

COMPULSORY ATTENDANCE.

The State superintendent emphasizes the importance of the enactment of such laws as will secure the attendance at school of all children of school age who are not disqualified mentally or physically, or who are not in private schools. The right of parents to have their children educated in private schools or at home should always be fully recognized and respected, but it should be required that the instruction there given be equal to that given in the public schools. The necessity for compulsory attendance is palpable when we consider that the school property of the State is estimated at fifteen million dollars, and that the annual expenditure for schools is five million dollars, but that only sixty-eight per cent. of the children of school age are enrolled, and only fifty-four per cent. of them are in average attendance. If the statistics of the attendance were properly kept and returned it would be found that the attendance was much less than that here represented.

THE STATE BOARD OF EDUCATION.

The superintendent thinks that the State board of education should be enlarged by the addition of three county superintendents, not more than two of them to be of the same political party, and that the powers of the board should be increased. It should have sole power to commission high schools for the admission of graduates therefrom into the Freshman class of the three State institutions; it should have control of both county and township institutes; it should prescribe lists of books from which additions should be made to the township libraries; and it should be empowered to adopt such regulations as it might deem essential to the interests of the schools.

TOWNSHIP TRUSTEES.

On account of the township trustees being guardians of the poor, inspectors of elections, and supervisors of roads and bridges, they are in a large number of cases, perhaps in a majority of cases, not selected with reference to their qualifications as school trustees. On this account school officials should be entirely distinct from those having charge of elections, roads, and bridges.

TOWNSHIP LIBRARIES.

In all townships where there are no libraries they should be established, and additions should be made to those already established. They should be managed according to rules and regulations made by the State board of education.

COUNTY SUPERINTENDENTS.

They should be furnished with suitable offices and should be paid for all necessary expenses of printing, stationery, etc. As they are required to visit the different schools and to examine the papers of a large number of applicants for teachers' licenses, a faithful performance of which duties requires considerable ability and much time and labor, no one can question the justice and propriety of paying them a suitable salary.

HIGH SCHOOLS.

The popular appreciation of, and demand for, the advantages of secondary education is manifested by the fact that under a permissive statute there have been established nearly five hundred high schools and graded schools with higher courses of study, all of which are in a prosperous condition. The graduates of one hundred of these schools are permitted by the regulations of the board of education to enter the Freshman class of Indiana University, Purdue University, and the State Normal School without examination. The time has arrived when high schools should be established in all parts of the State upon such a system and with such a standard, to be prescribed by the State board of education, as would permit their graduates to enter the Freshman class of the three institutions above named without examination.

SCHOOL FUNDS.

During the past two years special attention has been given to the status of the school funds in the various counties, and, as a result, there were collected each year about twelve thousand dollars more than in the preceding years and about two hundred thousand dollars were added to the permanent funds.

There are two distinct funds devoted to school purposes, the Congressional township fund, and the common school fund; the latter is made up of the surplus revenue fund received from the United States Government in 1837, the bank-tax fund derived from a tax on the State bank chartered in 1834, the saline fund, the sinking fund, and the semi-annual fund.

MAINE.

[From Report for 1887-88 of State Superintendent N. A. Luce.]

a The statistics contained in this summary differ slightly from the returns made to the Bureau of Education.

ATTENDANCE.

There was a small decrease in the number of persons of school age in the State, as was the case in the previous year also. The aggregate decrease for the last decade, however, was only 2,641, while in the preceding decade the decrease was 10,403. It is a legitimate inference, therefore, that the decrease in school population will soon entirely disappear.

When it is remembered that almost one in every three of those entitled to school privileges is not attending, and that almost one in every five of those who do attend is a truant, it becomes manifest that the schools are not accomplishing what they should. This fact cannot be denied, but the evil of non-attendance is not so great as might at first be supposed. There are several ways in which to account for it. Many children are kept at home during the first two years they are entitled to school privileges, because their parents consider them too young to attend school. Some do not attend because they have already reached a grade of education higher than can be furnished by the schools to which they are accessible. Others do not attend on account of poverty and the cost of text-books; others on account of parental indifference or greed. Free text-books should banish one of these obstacles; an efficient truant law should overcome another.

SCHOOLS AND SCHOOL TERMS.

The tendency to consolidate small and poor ungraded schools into a few large and well-managed graded schools has become quite marked of late. During the last six years there has been a decrease of three hundred and twelve in the number of ungraded schools, and an increase of one hundred and fifty in the number of graded schools; this indicates that there has been a better grade of teachers, better supervision and accommodations, and better work accomplished.

The average term of the schools was only twenty-two weeks and two days, and many schools had much shorter terms. Very little benefit can be obtained during such short terms; nor is it equitable to limit one school to a term of three months while the school adjacent to it is maintained eight months.

It is not necessary that larger amounts be appropriated to the schools in order to secure longer terms, but by discontinuing many small and unnecessary schools, and by abolishing the district system, which is the source of much waste and criminal misuse of funds, it is probable that at least two weeks could be added to the average annual length of the schools.

TEACHERS.

The number of women teaching still continues to increase, but there was a decrease in the number of male teachers. As the services of women can be obtained at much lower rates than the services of men, and as there was an increase in the salaries of women teaching, it is to be inferred that there was an improvement in the qualifications of the teachers. Another favorable indication was the increased number of teachers continued in the same schools, but the number of changes of teachers is still entirely too large.

TEXT-BOOKS AND APPLIANCES.

It is a matter of congratulation that hereafter both uniformity and a full supply of text-books can be secured, as the Legislature in 1889 provided that school books should be furnished to the pupils of each town at the expense of the town. This law is to go into effect in August, 1890.

As regards maps, globes, charts, etc., the ungraded schools are very poorly supplied. In but one of every three ungraded schools is there a wall map, in but one of every eight is there a chart of any sort to aid in teaching, and in but one of every nine is there a globe.

RESOURCES AND EXPENDITURES.

The increases and decreases in respect to income and expenditures were practically the same as in the previous year. A larger sum was expended for teachers' wages, but this was offset by a smaller expenditure for incidental repairs of school-houses. The State superintendent thinks that a great deal of the school money is wasted and misused; until this is remedied, it is not desirable that the school funds be increased.

DISTRICT SYSTEM.

The State superintendent is strongly in favor of the Legislature abolishing the district system and substituting the town system therefor. One of the advantages arising from it would be equality of school privileges throughout each town. Under the present system, school funds are divided among the schools in proportion to the number of pupils in each district; in this way thinly populated districts receive only enough money to maintain a school for a very short term, while populous districts receive more money than they need.

By making the change, equality of taxation, better teachers, better supervision, better school-houses, economy of taxation, and longer school terms would be secured, and many unnecessary schools would be abolished.

A large majority of the intelligent and influential citizens of the State are in favor of the change; it has already been adopted in many towns, and in those towns which have not yet adopted it, it has many supporters.

COMPULSORY ATTENDANCE.

According to the law of 1887 all children between the ages of eight and fifteen years are required to attend school each year for at least sixteen weeks. Although this law has been in force only a short time, several serious defects have been discovered. Many towns have failed to elect the truant officers required by law, although such towns are liable to prosecution and fine. Children that have been furnished for a like period of time with instruction equal to that of the public schools are exempt from the requirement, but no provision has been made for determining this. According to the provisions of the law, attendance cannot be enforced until so much of the term has elapsed that the required amount of time cannot be had in the remainder of the term. Besides, when pupils enter a graded school at the middle or last of a term they cannot be properly classified.

FREE HIGH SCHOOLS.

The high schools are becoming more and more an essential part of the public school system, and they are already doing a very important work in furnishing a large and constantly increasing number of teachers for the common schools.

NEW LEGISLATION.

Free text-books.—The Legislature of 1889 enacted that after August 1, 1890, the pupils should be furnished with text-books at the expense of their respective towns.

Evening schools authorized.—Cities and towns were authorized to raise money to support evening schools.

School laws to be published biennially.—It is made the duty of the State superintendent every two years to publish the amended school laws, and, also, such circulars of information and advice to school officers as may be necessary.

MARYLAND.

HIGH SCHOOLS AND ACADEMIES.

"In most instances the academy is now incorporated into the county school system; in a few cases the original independence is maintained, and in a few others there is an understanding between the trustees of the academy and the board of county school commissioners, by which the former continue to hold the title to the property, while the latter receive the 'donation' and conduct the business. In 1886 it seemed to be the policy of the State to give each of the counties \$1,200 a year for the support of an academy. This sum has been regularly paid to the academy, if one were in existence, and if not, to the school commissioners for the use of the public schools."

Superintendent Newell considers it essential to the cause of higher education in the State that there shall be maintained in every county at least one high school or its equivalent; or, where this shall be found impracticable, that there shall be at least one teacher in the county who can prepare pupils for entrance to college.

NEW LEGISLATION.

The State tax for schools was raised from ten cents to ten and one-half cents on the hundred dollars, and the appropriation for colored schools was raised from one hundred thousand to one hundred and twenty-five thousand dollars on certain conditions.

"The elements of agricultural science may, in the discretion of the State board of education, be taught in the State Normal School and in the public schools of the State.

"Chapter 336 re-enacts the corresponding sections of the public school law relating to teachers' certificates, with the proviso that after six months' probation the examiner may issue a certificate which shall continue in force for five years." Heretofore the period was limited to three years.

Garrett County was added to those (Montgomery, Prince George, Charles, and Caroline) in which the school commissioners are appointed, not by the judges of the circuit court as in the other counties, but by the Governor, "by and with the consent of the senate."

MASSACHUSETTS.

[From Report for 1887-88 of Hon. John W. Dickinson, Secretary of State Board of Education.]

STATISTICAL SUMMARY.

	1886-87.	1887-88.	Increase or Decrease.

TAXATION FOR SCHOOLS.

There is a great disparity in the amount of money appropriated to each child in the different towns and in the percentage of valuation appropriated. The towns which appropriate the smallest sums per capita of school population are the ones in which the highest percentage of valuation is appropriated to school purposes. This shows that the weaker towns are making efforts to place their schools in as good condition as the best schools. It is the opinion of the board of education that the Commonwealth should furnish greater financial aid to these poor country towns, and that this can be done in such a way as not to impair the habit of self-reliance which has so long existed in them. The towns particularly needing this assistance are situated along Cape Cod and in the western part of the State, remote from business centres and the great lines of travel.

HIGH SCHOOLS.

"High schools have been maintained the past year in one hundred and ninety-eight cities and towns. Forty-four towns, not required by law so to do, have maintained high schools. The whole number of such schools maintained the past year is two hundred and thirty. They are furnishing instruction to over twenty-two thousand pupils, and the population of the cities and towns in which high schools are maintained is over ninety-five per cent. of the whole population of the State. These figures furnish striking evidence of the high estimation placed upon the benefits of the education furnished by high schools.

"These schools are of two grades; the lower furnishing instruction in all those branches necessary to qualify youth to fill successfully most of the business pursuits and vocations of life, and the higher furnishing instruction in all required for admission to colleges and universities. High schools have, in recent years, made decided progress in all directions, especially in their organization and methods of instruction; and while they are still capable of much improvement, they are now worthy of the full confidence and the generous support which have been accorded them."

EVENING SCHOOLS.

All cities and towns having ten thousand or more inhabitants are required to maintain evening schools for the instruction of pupils over twelve years of age. There were two hundred and fourteen such schools, with an attendance of twenty-four thousand

seven hundred and twenty-five pupils. Five cities and towns failed to comply with the law, but eighteen towns maintained schools which were not required by law to do so. The most discouraging feature connected with the evening schools is the low average attendance—a difficulty not easily remedied.

TEACHERS.

The number of male teachers is steadily decreasing. There are fewer changes of teachers, however, and consequently those employed are enabled to do better work, and teaching becomes more like a profession. A larger number of teachers are graduates of normal schools, the ratio of normal school graduates to the whole number of teachers having increased in the last eight years from twenty-two to twenty-seven per cent. The salaries of teachers have increased quite rapidly; particularly is this true of male teachers, the average monthly salary of whom is \$119.34. The standard of teachers' qualifications has been raised even more rapidly than the compensation.

PRIVATE SCHOOLS.

The number of children reported as attending private schools is thirty-seven thousand two hundred and ninety-one, which is a much larger number than ever before, and is more than twice as many as attended private schools ten years ago.

SUPERVISION.

The importance of competent supervision of the schools has been so generally acknowledged that twenty-eight towns and all but two cities in the State have for years employed a superintendent of schools, but in the smaller towns there has been no supervision except that given by the occasional visits of the school committees. Provision was long ago made by law for the union of two or more towns in the employment of a superintendent; but, either on account of the expense of having a superintendent or on account of anticipated difficulties in the joint action of districts, no towns availed themselves of the privilege. In 1888, however, it was enacted that if any two or more towns, the valuation of each of which does not exceed two and a half millions of dollars, together raised and appropriated for the employment of a superintendent not less than seven hundred and fifty dollars, the State should furnish them five hundred dollars to supplement the superintendent's salary, and five hundred dollars more to be used in paying the salaries of teachers. Hence, any district that raises seven hundred and fifty dollars for the employment of a superintendent receives one thousand dollars from the State. Several districts have already taken advantage of this offer, and it is thought that eventually all the towns will be thus provided with superintendents.

FREE TEXT-BOOKS.

The law providing for free text-books has been in operation about five years. It seems, from the returns, to have increased the school attendance more than ten per cent.; in the high schools especially it was immediately followed by a largely increased attendance. The testimony in favor of the law is decided and unanimous.

STATE AGENTS.

By reason of the increased appropriations for State agents, the board of education was enabled to increase the number of agents to five. The duties of agents are to visit the schools, confer with teachers and committees, conduct teachers' meetings, etc. They are general superintendents of the schools.

One of the agents was employed for the special purpose of introducing industrial drawing into the public schools and of giving instruction in that branch. Much interest in this department has been awakened, and the teachers are earnestly endeavoring to acquaint themselves with it.

The State was divided into four parts, and each of the other agents was detailed to look after the schools in one of these sections. Their attention was given especially to the schools of the smaller towns, which have little or no intelligent supervision, and consequently their services were of great value.

PHYSICAL EDUCATION.

"As the body is the instrument which the mind uses in its efforts for knowledge and development, every complete system of education should include in its provisions a carefully prepared plan of physical training. Not only should the conditions of physical health be observed in selecting the location and site of the school-house, in its construction and in its use, but they should also be observed in directing the children to good habits of living and study. The value to the individual of a sound body cannot be overestimated. Health is a condition of right intellectual and moral development, of usefulness and happiness. To secure it the laws of health must be observed from the earliest years of the child's life. This must be done under the wise direction of parents at home and of teachers at school until the child has acquired knowledge and self-control enough to enable him to take care of himself.

"In the examination of teachers for the public schools, their knowledge of the principles and methods of physical education should be determined with the same care as is exercised in testing their ability to teach any of the branches of learning."

CHARACTER OF PUBLIC SCHOOL INSTRUCTION.

The public schools are regarded by some as Godless institutions. While it is true that the public schools do not teach any particular form of religion, it is also equally true that they are not anti-religious.

"The people will never submit to a general tax for ecclesiastical objects concerning which the State has no right to express any opinion, and over which it has no right to exercise any control, but they will freely support those institutions whose exclusive aim it is to train their pupils to become intelligent, virtuous, and loyal citizens of a free commonwealth. While the public common school, from the nature of the case, must exclude from its exercises those topics of study and that training which have for their objects special forms of religious belief and religious service, it should with great fidelity communicate a knowledge of the moral qualities of human conduct and furnish occasions for acquiring facility in the practice of every virtue."

"What harm can come to a true religion from the ability to read or to perform arithmetical problems; from a knowledge of the constitution and uses of things in the natural world; from an understanding of the principles and forms of our civil government; from the power to reason correctly; from a training in the practice of good manners, or from the cultivation of the virtues which are the ornament of society and the basis of a republican constitution?"

MISSISSIPPI.

[From Letter of State Superintendent J. R. Preston to the Commissioner of Education, May 17, 1889.]

"Public education is steadily advancing in Mississippi. Within the past year we have expended over two hundred thousand dollars in school buildings, some towns having put up twenty-five and thirty thousand dollar buildings for graded schools. Nearly all our towns of fifteen hundred inhabitants and over have graded schools in session from seven to ten months, and several counties this year will have six months of free school in the country districts. The cause is prospering with us, and we have strong and abiding hopes that an educational revival is not far in the future."

NEW JERSEY.

[From Report for 1887-88 of State Superintendent Charles W. Fuller.]

STATISTICAL SUMMARY.

	1886-87.	1887-88.	Increase or Decrease.
POPULATION AND ATTENDANCE.

TEACHERS AND SALARIES.			
Men teaching.....	825	796	D.....29
Women teaching.....	3,177	3,325	I.....148
Average salary of men per month.....	\$64.07	\$67.24	I.....\$3.17
Average salary of women per month.....	\$41.34	\$42.35	I.....\$1.01
REVENUE.			
State school tax appropriated.....	\$1,456,660	\$1,870,055	\$413,395
Additional State appropriation.....	100,000	100,000	
Township school tax.....	62,473	48,992	D.....13,481
Interest of surplus revenue.....	31,863	32,084	I.....216
District and city tax for teachers' salaries.....	423,692	474,293	I.....50,601
Total amount for maintaining schools.....	2,074,692	2,525,425	I.....450,733
District and city tax for building and repairing school-houses.....	571,184	590,016	I.....18,832
Total amount for school purposes.....	2,645,876	3,115,441	I.....469,565

REVENUE.

The recent act of the Legislature raising the amount of State school tax from four dollars to five dollars for each child between the ages of five and eighteen, together with the increase of 13,836 in school population, resulted in the receipt of a much larger school fund than heretofore and the payment of much better salaries to teachers. The school funds received from the State are sufficient to meet all current expenses of the schools in the rural districts, but in the cities and larger towns it is found necessary to raise an additional amount.

TEACHERS AND SALARIES.

On account of the higher rate of State taxes for schools and also on account of the act passed in 1887 which provided for the re-apportionment of any balances of the State appropriation remaining in the hands of township collectors, the salaries of teachers have been higher than ever before. The average annual salary of men in cities was \$1,265.23; of women, \$473.29.

Twenty-seven per cent. of the teachers in the State have taught in the same school one year or less, thirty-eight per cent. between one and five years, seventeen per cent. between five and ten years. The average for all the teachers was five years and five months, an increase of seven months. The average total experience of teachers in the State was eight years and three months.

SCHOOL-HOUSES.

The number of school-houses in the State is 1,615, but of this number 157 were rated by the county superintendents as poor or very poor. Thirty new buildings were erected during the year. The average value of the school-houses of the State is \$5,005. The total value of school property in the State is \$7,837,706.

The necessity for greater school accommodations is again brought prominently forward by the State superintendent, who says that while the school population is increasing from year to year the number of school-houses remains about the same. The seating capacity of the school-houses was only sufficient for fifty-four per cent. of the school population, while there was an attendance of fifty-nine per cent., showing that there was an overcrowding of the school-rooms by four per cent. of the school population. In the cities, however, the overcrowding was still greater. In some of them it was found necessary to adopt half-day sessions for the primary grades. Sixty-three rooms were reported as having over eighty pupils and twenty-one rooms had over one hundred pupils.

The superintendent heartily endorses the recommendation that plans and specifications for school-houses be prepared and kept in the office of the State superintendent, where they may be examined and adopted by district officers when about to build school-houses.

In regard to the furniture of the schools, a steady improvement has been noted; means have also been provided by which the schools, at a slight expense, can provide themselves with reference books and the ordinary library books.

OHIO.

a Some of the statistics contained in this summary differ slightly from the returns made to the Bureau of Education.

Commissioner Hancock pays a worthy tribute to the memory of his distinguished predecessor in the office of State commissioner of common schools, Dr. Eli T. Tappan, who died October 23, 1888. Dr. Tappan began his work as an educator in the public schools of Steubenville in 1857, but he was soon elected professor of mathematics in the Ohio University at Athens, which position he held until 1863, with the exception of a few years spent as professor in the Mt. Auburn Young Ladies' Institute. In 1869 he was elected president of Kenyon College, with which institution he was connected until he entered upon his duties as State commissioner of common schools.

Although he was connected with institutions for higher education nearly all his life, yet he took an active interest in the work of the common schools and did much to improve them. Probably no man in the State was better acquainted with their condition and needs.

In February, 1825, a general school law was passed; by it for the first time a general tax for school purposes was required to be levied. No provision was made for normal schools or for supervision, and neither of these provisions has yet been supplied. Outside of the cities and larger towns there is practically no supervision. All but ten of the other States and all the Territories but three have county supervision.

In 1847 a law was passed permitting county supervision whenever the county commissioners should appropriate a sufficient sum to pay the salary of a superintendent.

Only three counties ever availed themselves of this privilege. What is needed is a general school law providing supervision for all the schools of the State.

Many of the teachers employed in the public schools in rural districts have not had the necessary experience to become thorough teachers, and so long as the salaries of teachers remain as low as at present it cannot be expected to be otherwise. Superintendents are needed to improve the work of such teachers.

VIRGINIA.

[From Report for 1887-88 of State Superintendent John L. Buchanan.]

GENERAL STATEMENTS.

A review of the work done by the public schools for the last five years shows that the schools have been gradually but uniformly improving. But there still remains a very large proportion of the school population not attending school. The number of children five to twenty-one years of age was about six hundred thousand, but the school enrollment was only a little over three hundred thousand, or 54 per cent., and the average daily attendance was less than two hundred thousand. Of these pupils, 9,886 were furnished with text-books by the State. There was an increase of one hundred and twenty-nine in the number of schools, but a slight decrease in the salaries of teachers and in the length of the school sessions.

COMPULSORY ATTENDANCE.

The non-attendance and irregularity of attendance of the children of school age is regarded as a very great evil, though not greater in Virginia than in some of the other States. It is an evil, too, which the State superintendent thinks it will be difficult to overcome. In twenty-four States and Territories laws for compulsory attendance have been enacted, but it is doubtful if such a law would prove effective in Virginia, where four-fifths of the population live in rural communities and in some places the population is quite sparse.

COUNTY SUPERINTENDENTS.

According to the Constitution of the State, county superintendents are to be appointed by the board of education for a term of four years, and are subject to removal for cause. According to a recent decision of the court of appeals, the term of office of all the county and city superintendents will expire on the 30th of June, 1889. Hence new superintendents are to be appointed.

"This office is of very great importance. It is well established by experience that no State school system can succeed without local supervision, and the more efficient this is, the greater the success of the system. Observation warrants the statement that in every county in this State where there is an intelligent, judicious, energetic, earnest superintendent the school work prospers, and where the superintendent lacks these qualifications the school work will lack vitality. It could not well be otherwise, in view of the manifold and responsible duties of this officer."

COUNTRY SCHOOLS.

Country schools labor under many serious disadvantages as compared with city schools. The income from local levies is much smaller, and consequently there are inferior buildings, poor furniture, smaller teachers' salaries, and shorter terms. They receive very little supervision from the county superintendents, and little or none from the local trustees. They are not usually so overcrowded as the city schools, however, and so each pupil can receive more of the teacher's attention.

GRADING OF SCHOOLS.

A plan for the grading of country schools was prepared by one of the teachers in the State Female Normal School, and has been included in the report of the State superintendent.

A great many persons who are interested in educational matters fail to get a correct idea of what a graded school is.

In a graded school each subject to be taught is divided into parts, and these parts are arranged in the order of their difficulty and complexity.

Groups are formed of the corresponding parts of each of the subjects, and are proportioned to the power and knowledge of the pupils for whom they are intended, and to the time in which they are to be taught.

Pupils are required to take all the studies of the grade to which they belong, and these must be completed before any study in the next grade is begun.

There are appointed times for general promotion, but a pupil may be promoted or demoted at any time at which it seems advisable.

The system has its disadvantages as well as its advantages; but, on the whole, it is preferable to other systems of classification.

The number of rooms or of teachers does not determine whether a school is graded or not; a school having one teacher may be just as truly graded as one having twenty teachers.

MANUAL AND INDUSTRIAL TRAINING.

This is a subject which receives much attention from educators at the present time, and the public sentiment in its favor is increasing; but there are many still strongly opposed to it. As its introduction into the public schools of Virginia would involve the expenditure of a large sum of money and necessitate the employment of teachers competent to give instruction in it, the State superintendent does not think it should be attempted at the present time.

PUBLIC SCHOOL INSTRUCTION.

Some of the criticisms made upon the instruction given in the public schools have been as follows:

1. They fail to teach morality or to cultivate the religious sentiment.
2. They fail to give an adequate mastery of the subjects of instruction.

As to the first criticism, it is not thought that the public schools fail to teach morality, and there is no reason why they should not teach it. "Is it leaning toward sectarianism or trespassing on anybody's liberty of conscience that the public schools should teach their pupils truthfulness, honesty, reverence, self-respect, self-control, regard for the rights and feelings of others, sobriety, decorum, and other kindred virtues? Surely

not; for these things are approved by all right-thinking people; they constitute, as has been well said, the practical side of religion; they are the essential elements of good character and good citizenship.

"But the upright, conscientious, earnest teacher is the most impressive lesson to the pupil. His example, his character, his spirit, is a constant moral force acting on the pupil when out of school as well as when in school, and to say that there are not a large number of such teachers in the public schools would be untrue."

As to the second criticism, that the public schools fail to give a mastery of the subjects taught, it is true in regard to many of them. There are many things to account for this; short terms, irregular attendance, frequent changes of teachers, incompetent teachers, etc. Even if it be granted, however, that the second criticism is true, the work of the public schools may still be of great value.

III.—RECORD OF WORK ACCOMPLISHED BY THE BUREAU FROM AUGUST 5, 1886, TO SEPTEMBER 3, 1889.

The work accomplished by the Bureau of Education during the past three years has been very extensive, and the results obtained fully demonstrate the utility and value of the Office to the country at large as an educational agency of the General Government. The status of the Bureau has been maintained during this period, as the resolutions approving the work undertaken and successfully completed passed at the meetings of the National Educational Association in 1887 and 1888 amply testify.

The practical value of the Bureau of Education to the vast army of American educationists is well exhibited in the following résumé of the correspondence and documentary record of the Office for the past three years.

During the year 1887 the Bureau received: written letters, 11,006; acknowledgments, 43,990; documents, 4,825; and 20,000 replies to statistical forms of inquiry; and sent out 19,354 written letters and distributed 218,526 copies of documents. In 1888, 15,197 written letters and 240,000 copies of documents were sent out, besides more than 14,000 statistical forms of inquiry; while 11,096 written letters, 12,000 statistical returns, 44,000 acknowledgments, and 6,913 documents were received.

One of the most important improvements in the internal organization of the Office has been the reduction of the number of the divisions into which it had formerly been divided, viz, from seven to three, called, respectively, the Division of Records, the Division of the Library and Museum, and the Division of Statistics. By this reduction the business of the Office has been greatly augmented, and promptness, despatch, and accuracy attained.

The publications of the Bureau have attracted great attention, not only from the leading educators of this country, but from those of foreign nations.

The press, too, has favorably criticised the interesting series of circulars of information issued by the Office, and has quoted largely from them, which is a gratifying evidence of the tide of popular opinion regarding the status and educational worth of such a branch of the General Government as a National Bureau of Education.

PUBLICATIONS.

The publications are divided into three divisions: Annual reports, special reports, and circulars of information.

During the period under review the scope of the annual reports has been broadened, and the promptness of publication, a desideratum of vital interest to educationists, has been advanced.

The following is a complete enumeration of the documents issued by the Bureau, with a list of those in press and in course of preparation from August 5, 1886, to September 3, 1889:

A.—Documents begun during the term of office of Commissioner John Eaton, but not finally completed, the work being finished, published, and distributed by his successor:

- (a) Annual Report for 1884-85.
- (b) Circular of Information No. 1, 1886: Study of Music in Public Schools.
- (c) List of Libraries in the United States.
- (d) The Special Report on Educational Exhibits and Conventions at the New Orleans Exposition of 1884-85.
- (e) The Special Report on Indian Education and Civilization.

B.—Documents projected and completed entirely during Commissioner Dawson's administration:

- (a) Annual Report for 1885-86.
- (b) Annual Report for 1886-87.
- (c) Circular of Information No. 2, 1886: Proceedings of the Department of Superintendence of the National Educational Association for 1886.
- (d) Circular of Information No. 1, 1887: The College of William and Mary.
- (e) Circular of Information No. 2, 1887: The Study of History in American Colleges and Universities.

B.—Documents projected and completed entirely during Commissioner Dawson's administration—Continued.

- (f) Circular of Information No. 3, 1887: Proceedings of the Department of Superintendence of the National Educational Association for 1887.
- (g) Circular of Information No. 1, 1888: Thomas Jefferson and the University of Virginia.
- (h) Circular of Information No. 2, 1888: History of Education in North Carolina.
- (i) Circular of Information No. 5, 1888: Industrial Education in the South.
- (j) Circular of Information No. 6, 1888: Proceedings of the Department of Superintendence of the National Educational Association for 1888.
- (k) Circular of Information No. 3, 1888: History of Higher Education in South Carolina.
- (l) Circular of Information No. 4, 1888: Education in Georgia.
- (m) Circular of Information No. 7, 1888: History of Education in Florida.
- (n) Circular of Information No. 1, 1889: Higher Education in Wisconsin.
- (o) Report of the Visit to Alaska of the Hon. N. H. R. Dawson, Commissioner of Education, 1887.
- (p) Alaska: An Address by the Commissioner of Education before the Department of Superintendence, February 16, 1888.

C.—Documents in press Sept. 3, 1889:

- (a) Annual Report for 1887-88.
- (b) Special Report upon American Education in Fine and Industrial Art, Part II.
- (c) Special Report on Public Libraries, Part II: Rules for a Dictionary Catalogue.
- (d) History of Education in Alabama.
- (e) Higher Education in Indiana.
- (f) History of Federal and State Aid to Higher Education.
- (g) Proceedings of the Department of Superintendence of the National Educational Association for 1889.
- (h) The Teaching and History of Mathematics in the United States.

D.—Documents in course of preparation:

- (a) Annual Report for 1888-89.
- (b) Monograph on School Architecture and Hygiene, by Dr. A. P. Marble, superintendent of public schools, Worcester, Mass.
- (c) Monograph on Examinations and Promotions, by Dr. E. E. White, superintendent of public schools, Cincinnati, Ohio.
- (d) Monograph on the Training of Teachers in the United States, by Prof. J. P. Gordy, of the Ohio University, Athens, Ohio.
- (e) Report on the Educational Congresses and Exhibits at the Paris Exposition, 1889, by Dr. W. T. Harris.
- (f) History of Normal Schools, by Hon. M. A. Newell, State Superintendent of Public Instruction, Baltimore, Md.
- (g) Monographs on the educational history of Maine, Massachusetts, New Hampshire, Vermont, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia, Ohio, Kentucky, Tennessee, Mississippi, Louisiana, Texas, Arkansas, Kansas, Missouri, Iowa, Minnesota, Nebraska, Nevada, California, and Oregon.

Work upon the Annual Report of the Office for 1888-89 was taken up in the spring of 1889, as soon as the compilation of the Report of the preceding year had been finished, and by the close of August had made considerable progress toward completion. It is hoped that it may be completed and ready for printing by the end of December.

One of the most interesting and valuable inquiries ever projected by the Bureau of Education in behalf of the educational interests of the country has been the exhaustive investigation set on foot into the history of education in the various States of the Union. The conception was an original one, and the results of the researches have thus far been eminently satisfactory. The inquiries have done much to stimulate and promote education in the States, and have attracted great attention from leading scholars and educators of the United States. The work has been done under the editorial supervision of Dr. Herbert B. Adams, of the Johns Hopkins University, whose particular abilities as an original historical investigator are well known and appreciated.

These publications, though embraced in the generic term Circulars of Information, nevertheless are distinct, occupying a field peculiarly their own, and are called Contributions to American Educational History. Seven have been published and widely distributed throughout the country up to September 3, 1889.

The first of the series, a monograph upon William and Mary College, by the editor, Dr. Adams, proved to be a powerful agent in reviving the ancient historical institution of Virginia, as was freely acknowledged by General William B. Talliaferro, president of the board of governors.

The second, also written in the main by Dr. Adams, upon Thomas Jefferson and the University of Virginia, was an exhaustive and elaborate exposition of the undercurrent of ideas that led to the founding of the leading university of the South and the influence exerted by it upon Southern thought and educational progress. In addition to the editor's philosophical paper were authorized sketches of Hampden-Sidney, Randolph-Macon, Emory and Henry, Roanoke, and Richmond Colleges, and of Washington and Lee University, by the leading representatives of those institutions. The value of this monograph was enhanced by many fine illustrations, among which were fac simile copies of Jefferson's original drawings for the construction of the university buildings.

The third of the series was the "History of Education in North Carolina," by Dr. Charles Lee Smith, a native of that State and sometime Fellow in History at the Johns Hopkins University. The origin of the common school system of North Carolina was ably treated by the author in this monograph, and his information concerning the higher institutions of the State was mostly obtained from personal examination of college archives and inquiries minutely pursued in all quarters among the representatives of the institutions of both races.

The fourth monograph was on "The History of Higher Education in South Carolina," by C. Meriwether, of that State, a gentleman well trained at the Johns Hopkins University in historical research. This pamphlet has been admirably received, and contains several original historical documents unattainable elsewhere, the most interesting among them being the record of the early educational efforts made in South Carolina, when yet a colony, to advance the educational progress of her sons. In addition to tracing the development of higher education the author made interesting investigations into the evolution of the public school system of the State.

The fifth in the series relates to the "History of Education in Georgia," and is the work of Charles Edgeworth Jones, son of Col. C. C. Jones, of Augusta, the historian of the State. It is an able treatise on the institutions for both races in Georgia, and exhibits much interesting data concerning the inception and growth of the free-school system.

Prof. George Gary Bush, Ph. D., a graduate of Heidelberg University, prepared the sixth contribution to American educational history, and he was peculiarly fitted for the task owing to his winter residence in Florida for the past ten years. Although the materials were exceedingly scant for an elaborate treatise on the rise and progress of education in that State, yet Professor Bush produced a most creditable work and one of the most interesting in the series.

The seventh monograph treats of "Higher Education in Wisconsin," and was executed by Prof. William F. Allen, of the University of Wisconsin, and Mr. David Spencer, one of the advanced graduate students of that institution. The interest is maintained throughout, and the work exhibits careful investigation and analysis.

THE LIBRARY.

One of the most interesting features of the Bureau of Education is the library, which has been advanced, as far as means would allow, to a high state of excellence. The value of the pedagogical collection of the library, to which numerous accessions have been made within the past three years, cannot be too highly estimated when judged from the stand-point of the educator. Leading educators and writers of the country have fully appreciated its value in the past, and have on numerous occasions consulted its rich storehouse of pedagogical lore, notable among the recent investigators being Dr. Herbert B. Adams and the other contributors to the monographs on American educational history, Prof. Lucian Cajori, Prof. R. G. Boone, author of the interesting work recently published, "Education in the United States," and others.

Not only have inquiries been made by educators in this country, but correspondents from abroad have had recourse to the Bureau's library for information. The library force of the Office in response to these solicitations for information have prepared over five hundred cards the past year, containing references for investigators of various subjects.

On June 16, 1888, was commenced the preparation of a finding list of the library, which necessitated the copying of fifteen hundred pages of manuscript and the inscribing of some twenty thousand cards, the books in the meanwhile having been classified and re-arranged on the shelves according to subjects.

The fine collection of pedagogical and statistical works in the foreign section of the library was catalogued and arranged in a similar manner, which required a considerable amount of technical labor.

An important phase of the work in the pamphlet section was the chronological arrangement by decades or half decades, and the preparation for the bindery of the collection of college catalogues of the Bureau. Of these there have been bound over four hundred volumes.

The number of volumes and pamphlets in the library has been greatly increased. At the end of July, 1886, there were on the shelves of the library 18,500 volumes and 50,000 pamphlets; at the present writing there are 23,500 volumes and 90,000 pamphlets.

THE PERSONNEL OF THE OFFICE.

The two lists following give the names of the employés of the Office at the dates named, together with certain particulars regarding their terms of service, etc.:

I.—List of Employés August 6, 1886.

Name.	Whence Appointed.	Date of Original Appointment.	Date of Appointment in Force.	Legal Residence.		Compensation.
				State.	Congressional District.	
Chief Clerk.						
William H. Gardiner ¹	Ill.....	Feb. 14, 1882	Feb. 21, 1882	N. H.....	1st.....	\$1,800
Clerk.						
Isaac N. Wyckoff.....	N. Y.....	Sept. 5, 1884	Sept. 5, 1884	N. Y.....	19th....	1,200

DIVISION OF STATISTICS.
